LUBRICATING PUMPS

To be efficient should throw a heavy, steady stream of coolant at will of machine operator.

They should be rotary geared to force the coolant into deep cuts and bores. They should operate at low speed, thus insuring long life, but while running at low speed, pumps must also have large capacity.

All of these requisites will be found in the TRAHERN.

Trahern Pump Co. Rockford, Illinois.

HENDEY

Improved Centering Machine

ASSURES perfect results at low cost. The distribution of metal insures the maximum strength with the least weight of machine; in this manner we have conserved on material and hence on machine cost. Here are a few of the **Hendey** Improved Centering Machine features:—

The head is rigidly clamped to the bed, giving permanent alignment of spindle. Spindle is large in diameter with ample bearings, having felt oilers; front journal is made taper, after the well-known pattern of our lathe and milling machine spindles.

Jaws of vise and supporting block are made of steel, hardened and ground.

Jaws are aligned from spindle by proof bar carried in spindle. This care in alignment is exercised in order to enable machine to accurately center stock for finishing purposes after coming from turret lathe or screw machine.

Parallel movement of vise and block is maintained by means of the connecting rod and bevel geared drive at back of machine, controlled from handle at front of vise. No matter what the diameter of bar may be, it will always be supported in a horizontal position.
Saddles are gibbed and fitted to bed, and provided with binding handles for ready clamping in position.
Capacity of machine is from 5-16 to 4 inches inclusive.

Let us send our circular

If it's speed you need—

One trial will prove the advantage of Pratt & Whitney Milling Cutters. No matter what the nature of the work they will give you the highest production the machine is capable of.

They're designed for free, fast cutting. And tempered and seasoned to last longer.

PRATT & WHITNEY MILLING CUTTERS

Ask us for prices and details on Plain Milling Cutters, Side Milling Cutters, Inserted Blade End and Side Cutters, Screw Slot Cutters, Coarse Tooth Side or Plain Milling Cutters, Involute Gear Cutters, Concave, Convex, and Double Angle Cutters, Cutters for Spiral Mills, Roll Thread Die Hobs, Key-seating and Slotting Cutters, Straight and Spiral Cut End Mills (B. & S. and M. T. Shank), Spiral and Straight Shell End Mills, etc.

And we make formed cutters for special work also. All are backed by the guarantee for goodness that the P. & W. trademark indicates.

Where you can buy them—

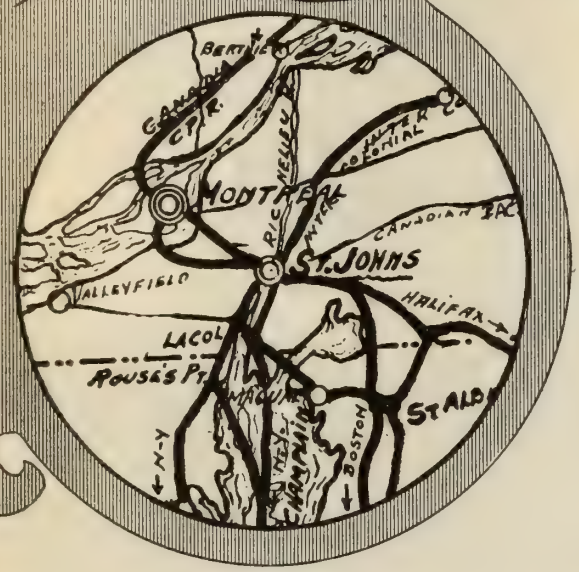
Canadian Machinery and Manufacturing News, November 27th, 1919. Vol. 22, No. 22. Published weekly at 143-153 University Ave., Toronto, Canada. Subscription price in Canada, $3; United States, $3.50. Entered as second-class matter at the Post Office Department, Ottawa, Canada. Entered as second-class matter July 1, 1912, at the Post Office at Buffalo, under the Act of March 3rd, 1879.

The City of ST. JOHNS, QUEBEC



ITS LOCATION It is located in the Province of Quebec which, as regards industries, is to Canada what New England is to the United States. (It is 27 miles, or 45 minutes, from Montreal).

ITS RAILWAYS

The two big railroad systems (double track) of Canada, the Canadian Pacific and the Grand Trunk Railways, pass through St. Johns, where merchandise can be shipped and exported anywhere upon the globe with dispatch. These railways are connected by a terminal switching system: charges at exceedingly low rate. All Eastern U.S. railroads are connected with St. Johns.

Direct Connections with Docks at Montreal

Goods can be exported direct by steamers to European, South African, South American and West Indian Ports.

St. Johns has long been recognized as the cheapest labor centre in Canada. Reasonable rents and living costs are keeping it so even in these times.

No other locality offers the following inducements to new industries---but we do

Exemption of taxes for fifteen years' period that is subject to extension. All public improvements which you may require, such as extension of streets, sidewalks, waterworks and sewerage; five per cent. bonus to you on your payroll for five years and if you wish we will advance this to you to be applied to the purchase or erection of any building suitable to your purpose.

ANNOUNCEMENT

THE ALGOMA STEEL CORPORATION, LIMITED, take pleasure in announcing to their customers and the Canadian trade that in accordance with the widespread desire throughout the Dominion that there should be obtained in Canada with Canadian labor, a much larger proportion of the requirements of this country in STEEL SECTIONS for STRUCTURAL PURPOSES, CAR CONSTRUCTION, SHIPBUILDERS' REQUIREMENTS, etc., they are just completing extensive alterations and additions to their rolling mills, and on or about 1ST NOVEMBER, will be ready to produce and ship American Standard Sections of BEAMS and CHANNELS up to and including 15", all standard sections of ANGLES from 6" x 6" down to 1¼" x 1¼", ZEE BARS for car builders and general purposes, small and large ROUNDS and SQUARES, and FLAT BARS up to 14" wide. The quality of the product is already well known to the trade, and is exclusively steel made by the Open Hearth process. and can be furnished in all grades from the softest rivet stock to high carbon special spring material.

MARK OF ALGOMA O.H. QUALITY

The following are the sections which will be rolled:---

ANGLES—Equal Leg—
6 x 6"—5 x 5"—4 x 4"
3½ x 3½"—3 x 3"
2½ x 2½"—2¼ x 2¼"
2 x 2"—1¾ x 1¾"
1½ x 1½"—1¼ x 1¼"

ANGLES—Unequal Leg—
6 x 4"—6 x 3½"—5 x 4"
5 x 3½"—5 x 3"—4½ x 3"
4 x 3½"—4 x 3"—3½ x 3"
3½ x 2½"—3 x 2½"—3 x 2"
2½ x 2"

BEAMS—
15", 12", 10", 8", 6", 5", 4", 3".

CHANNELS—
15", 13", 12", 10", 8", 6", 5", 4", 3".

ZEES—
3¼ x 5 x 3¼ x 5/16
3 5/16 x 5 1/16 x 3 5/16 x ⅜"
3⅜ x 5⅛ x 3⅜ x 7/16"
3 1/16 x 4 x 3 1/16 x ¼"

TWIST DRILLS
REAMERS AND MILLING CUTTERS

Quality First

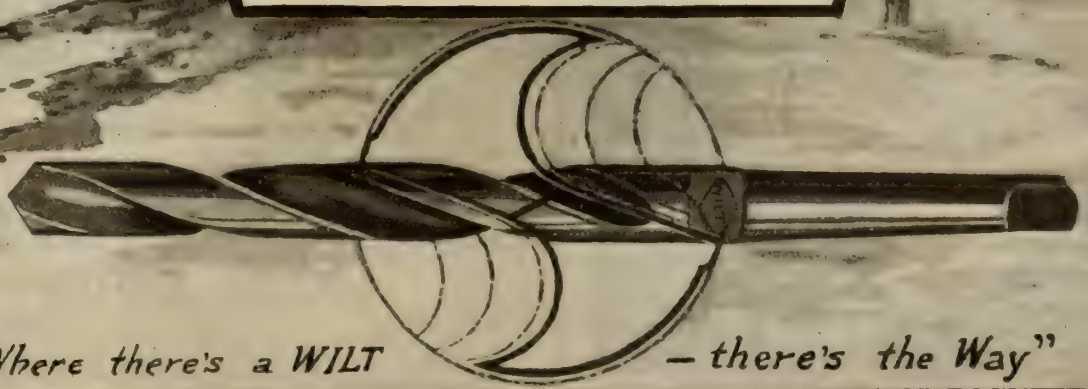
The Keystone Upon Which All WILT Products Are Built

A high standard of perfection is maintained throughout the various processes of manufacturing **WILT High Speed and Carbon Twist Drills, Reamers and Milling Cutters.** **WILT** products improve production! This is no theory, no untested statement, but an established fact backed by many of the largest manufacturers throughout Canada. For steady, reliable output of work that is satisfactory from the standpoint both of quantity and quality there is no better choice than **WILT Products.**

Put Them to the Test

WILT TWIST DRILL COMPANY
OF CANADA, LTD. WALKERVILLE, ONT.

London Office: Wilt Twist Drill Agency, Moorgate Hall, Finsbury Pavement, London, E.C. 2, England.



"Where there's a WILT — there's the Way"

The Air Compressor for Cramped Quarters

The short-belt drive for air compressors is long past the experimental stage. It is the ideal drive for a compressor installed where space is at a premium. The total floor space occupied by motor and compressor is reduced to a minimum, the belt expense is cut down—running is smooth and quiet. In our own power house we have three two-stage compressors with this drive; we would not have installed them if the short-belt drive were not satisfactory.

All C-I-R-Co compressors are built to carefully determined standards of quality and design. Not only is all material subject to inspection, all shop operations have to secure the O.K. of the chief inspector; finally comes the running test which every compressor undergoes before shipment. The C-I-R-Co has been building air compressors for over twenty years and has a reputation to maintain. Our compressor bulletins will interest you.

GARVIN No. 3 UNIVERSAL

CUTTER AND SURFACE GRINDERS

Simple Light Running Accurate

The spindle is hardened and ground and supported out close to the wheel by an extended bearing, and carefully protected from emery.

The knee and the yoke carried on the knee both have a large range of adjustment. On the knee yoke or carriage is mounted the swiveling table, which has a quick, sensitive movement by rack and pinion operated from end or side.

On this table is mounted the index head, and all the attachments are held in this head.

An outfit of emery wheels, mandrels, bushings, wrenches, etc., is supplied with the machine.

Machine is designed to keep its original factory accuracy.

CAPACITY: CUTTERS, 14" x 6"; SURFACES, 9½" x 6"

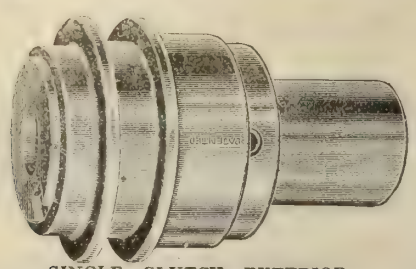
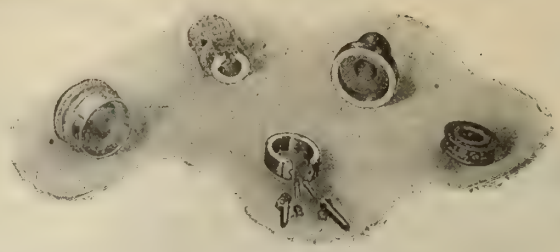
THE JOHNSON FRICTION CLUTCH



SINGLE CLUTCH—EXTERIOR



THE SIMPLEST WAY—AND THE BEST

In a clutch or any other mechanical device, unnecessary complication means trouble. Make a single part serve where two have been used before, and you have reduced by one-half the places that can break, wear or get out of adjustment. Put the cost of extra material into **better** material, and you have doubled the length of service.
In the Johnson clutch, this idea has been followed out to its practical limits. The result is a model of simplicity in clutch construction—a few sturdy parts, each correctly built and accurately tested for the duty it must perform. This lack of complication means continuous service and low maintenance cost. Johnson Friction Clutches stay on the job.

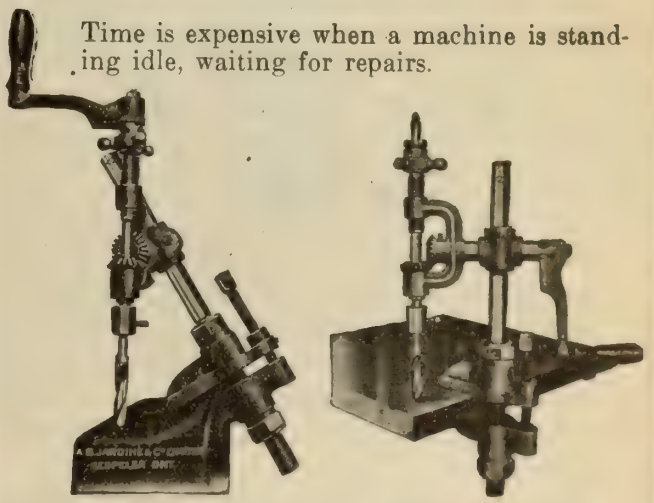
Jardine Universal Ratchet Drill

Time is expensive when a machine is standing idle, waiting for repairs.



On the average repair job, this machine completes the drilling in less than the time required to set an ordinary ratchet to begin.

Weight, 40 lbs. Price, $26.50 net

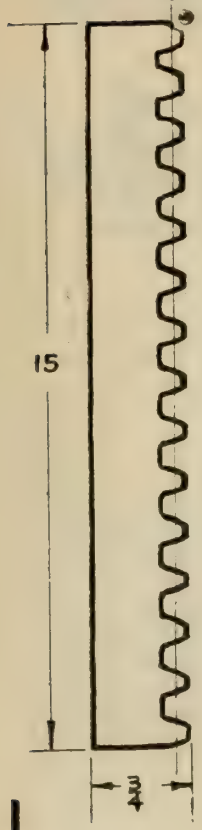
Production Milling
on the
Potter & Johnston
Automatic Milling Machine



The illustration herewith shows the method employed for cutting of racks in one of the largest shops in the country.

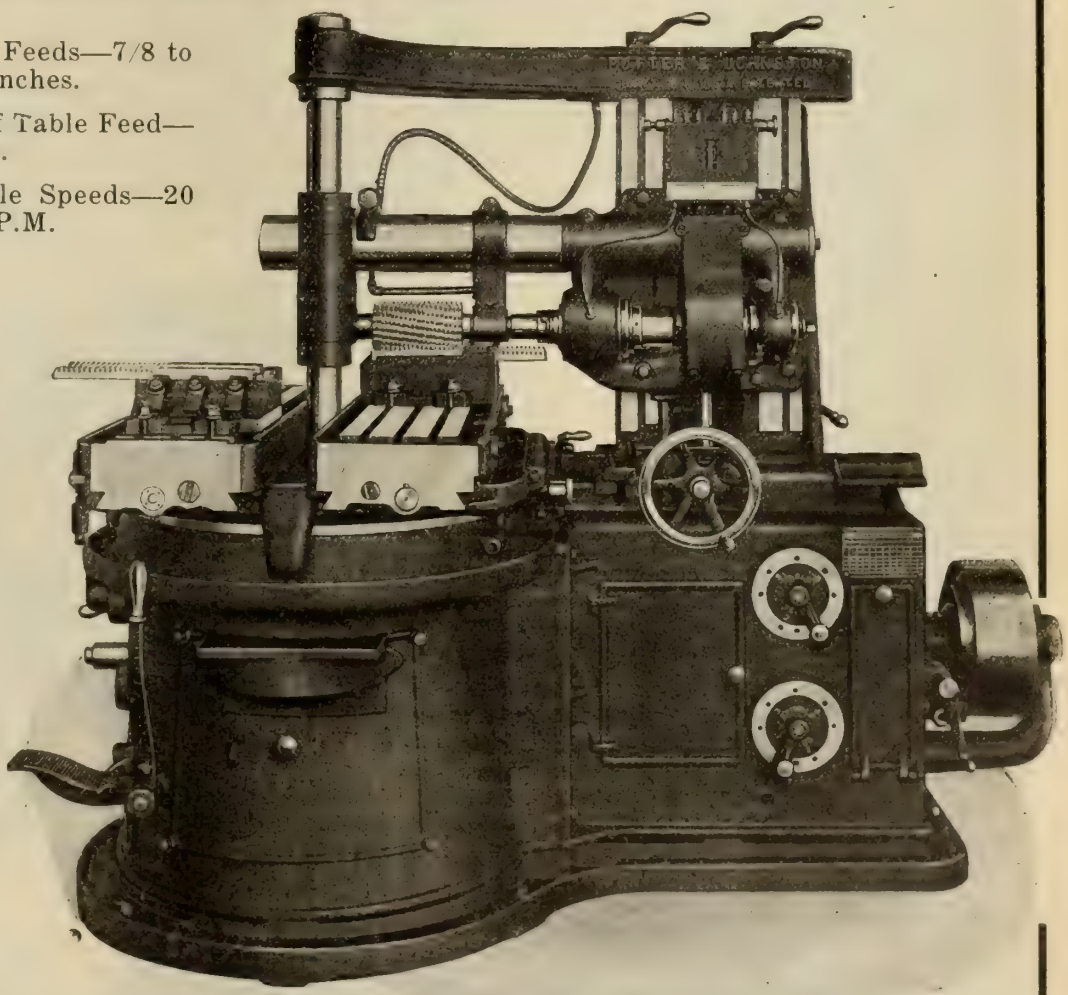
Two pieces are held in each fixture and the operation is carried out as follows:

Pieces are placed in fixture and the teeth are cut for half the length of the rack, the table then revolves to the loading position and while the cutter is working on the racks just placed in the fixture, the operator is reversing the pieces in the other fixture ready to complete the rack, when the table revolves to its next station.

16 Table Feeds—7/8 to 12 5/16 inches.

Length of Table Feed—29 inches.

16 Spindle Speeds—20 to 180 R.P.M.



Compare this method with yours. Maybe we can help you. We want you to know more about this Production Milling.

Write us to-day.

Protected-

Where there are acid and alkali fumes, where there is smoke, gas and dust, where there is moisture and salt air, *where there is need for building protection, within or without*—there Robertson Process Metal will give sure and lasting service.

What Robertson Process Metal Is

By the Robertson Process, three impervious coatings—(1) asphalt, (2) asbestos, (3) waterproofing are built up on specially annealed steel. These coatings are so thoroughly incorporated with each other and so firmly adhered to every part of the steel as to present a most enduring and weather-gas-fume repellent surface. It is both corrosion-proof and rust-proof; it minimizes condensation and is unaffected by natural or artificial elements.

This process of protection is applied to the steel in sheets, and bars for use in roofing, siding, ridge-caps, gutters, downspouts and general building trim. Robertson Ventilators and Skylights owe their long life to the fact that they are made of Robertson Process Metal.

Special bulletins covering technical details relating to the three Robertson basic materials, Robertson Process Metal, Robertson Process Gypsum, Robertson Process Asphalt, and a General Booklet in which there are brief descriptions of all Robertson Products, will be gladly sent upon request.

MILWAUKEE MILLING MACHINES

Double Overarm maintains alignment.

It is impossible for the operator to place the arbor supports on the arbor and double overarm in any other way than in line. Arbor cannot be pounded out of line when using large, coarse pitch cutters on rough, heavy work.

Other Distinctive Milwaukee Features:

Solid top knee—hardened steel gearing and shafts in the column and feed box—automatic flooded lubrication — one and one-half gallons of oil per minute pouring over all gears and bearings in the column and feed box, insuring lubrication at all times—flanged spindle with hardened steel collar for driving arbors—constant speed drive, reverse being self-contained.

Send for our No. 21 Catalogue. Illustrating and describing Milwaukee Milling Machines and accessories in detail

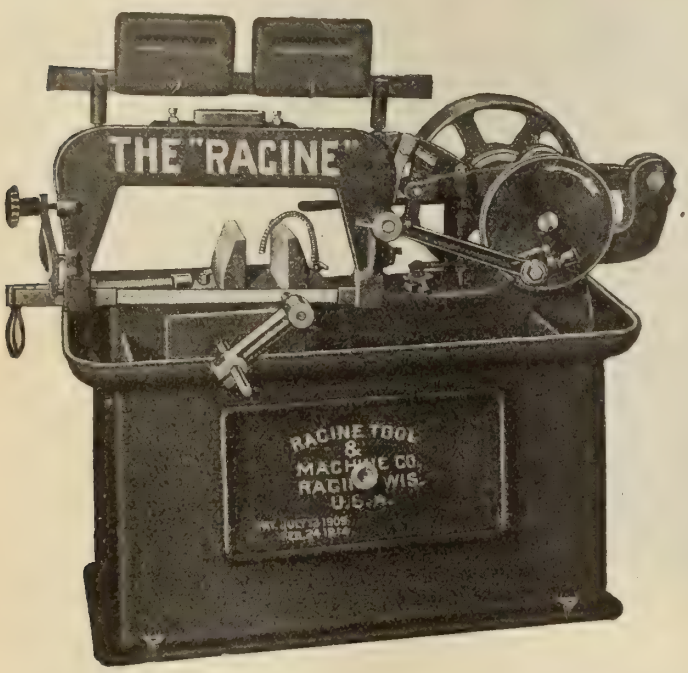
Standard the World Over

"THE RACINE"

HIGH SPEED METAL CUTTING MACHINE



Reduces Blade Expense

Aside from its ability to turn out more work than any other metal cutting machine, "THE RACINE" will save you considerable money on blades alone—enough to pay for itself in a reasonable time. The automatic lifting device is responsible for that. It automatically raises the blade on the return stroke, relieving it of all dragging or strain. This also means quicker cutting, less power used and greater production.

There are many ways "THE RACINE" will prove a big saving. Let us tell them to you.

Use "Racine" H.S. Tungsten Power Blades

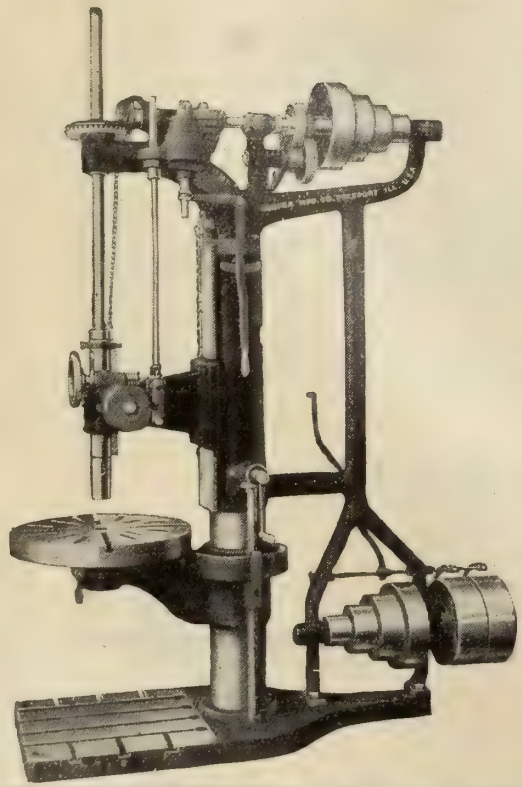
The Driller for Exact Work

HŒFER



Enable Your Workmen to Eliminate Spoilage

The Hoefer Driller is pre-eminently the one to be found in the best plants. "It's almost as good as a Hoefer," so often heard in the machine and tool trade, indicates the position held by Hoefer Drillers.

Exact drilling, to the last thousandth of an inch, pays by eliminating spoiled material. Hoefer Drillers pay for themselves and increase the workman's pride in his work.

Twenty-five Years on Market

Twenty-five years making drillers has given Hoefer the "Know-how." The Hoefer Drillers are used by many of America's leading manufacturers. Equip your factory the Hoefer way. Take any kind of a drilling problem you have to the Hoefer Manufacturing Company, and the Company's experts can tell you how it was solved by other men, some of whom you may know.

Investigate now. Write to-day for catalog. The Hoefer engineers are at your service.

BRISTOOL

Bristol 12-inch Rotary Precision Surface Grinder

Built for rapid production on grinding work.
It handles work either singly or in multiples within the capacity of the chuck and not thicker than 6-in., and grinds within quarter thousand in. of manufacturing accuracy.
And it is built to last.
It is provided with exceptionally long bearings throughout, especially in the back column. This prevents the wear, which is very slight, from affecting the accuracy of the grinder. The Back Column is made to swivel four degrees, which allows concave or convex grinding.
Bristol Rotary Surface Grinders are made in several types and sizes and are regularly equipped with 8-in., 12-in., and 16-in. magnetic chucks, either belt or motor driven and for dry or wet grinding.
Our Bulletin describes the many good points fully. Send us your name and address and we'll gladly mail you one.

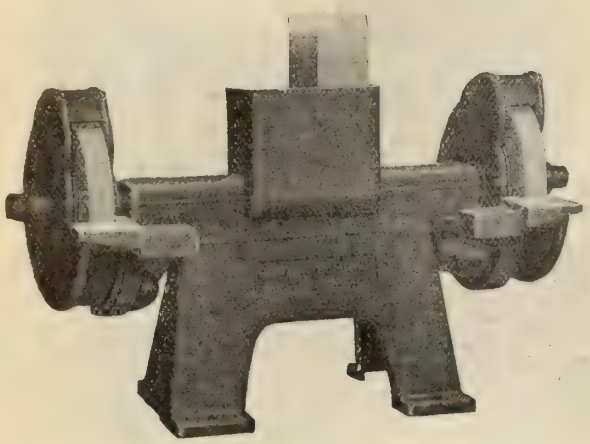
Notes On Grinding

NORTON COMPANY WORCESTER, MASS.

No. 69A



Safety With a Norton Floor Stand

Sturdy construction, excellent provision for safety in the equipment of a protection hood, facilities for the attachments of a dust exhaust system and belt protection devices together make the NORTON floor stand a safe and practical machine for the foundry and machine shop.

The operator works with ease, and this enables him to handle heavy work without extra strain. The absence of sharp corners, projecting parts and recesses where dirt and dust can lodge are further recommendations for this floor stand.

This ideal working combination is a NORTON floor stand equipped with ALUNDUM and CRYSTOLON wheels. The choice of the wheel depends upon the nature of the work to be ground.

ALUNDUM wheels for materials of high tensile strength—all kinds of steel.

CRYSTOLON wheels for materials of low tensile strength—cast iron, bronze, brass and aluminum.

AND
MANUFACTURING NEWS

Vol. XXI. No. 21 November 27, 1919

Broaching as an Aid to Greater Production

The First of a Series on the Above-Mentioned Subject. The Tools Used on Such Work, Together With Definite Practical Data Concerning the Same Will be Given

By FRANK H. MAYOH

BROACHING holes and broaching outside or inside shapes is now the most economical method of machining many parts which were formally considered of impractical design. Taking advantage of this, it is possible for a designer to make many parts which have had a tendency to slip of such a shape that they are positive in their action without additional cost to manufacture, and in fact these are often manufactured more economically.

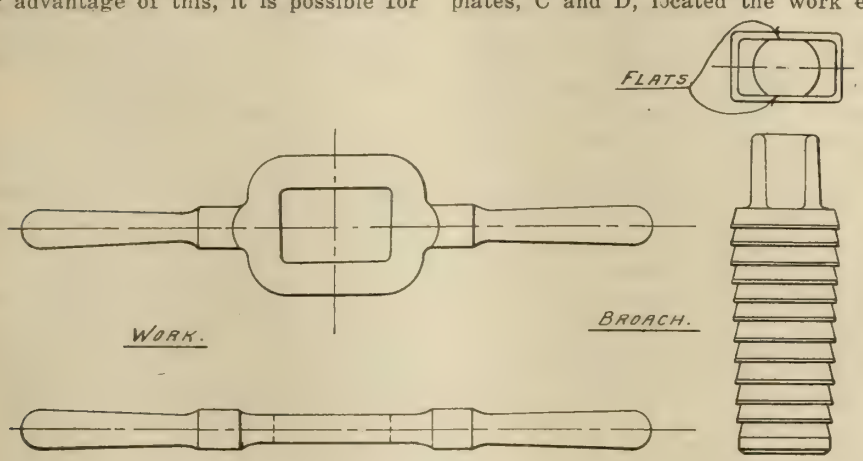

FIG. 1—WORK AND TYPE OF TOOL USED FOR PUSH BROACHING.

The Old Style Machine

Drifting back into ancient history I recall a big, rugged machine, formidable in appearance, placed out of the way, that was run about one month a year and shook the whole shop. No one knew much about this machine, it was something of a mystery, but it was nothing more than a big, clumsy press, used for push broaching the part shown by Fig. I. The press had a short stroke and, of course, the broaches were short and stubby, as shown, but nevertheless they did a good job, and by referring to Fig. 2, some idea of the class of tools used for this purpose may be had.

The fixture for holding the work is made of cast steel and is bolted to the platen of the press in the usual manner, while two plates, A and B, locate the work sideways and square it up, two plates, C and D, located the work endwise. At the right of this illustration the broach holder is shown, this fits into the ram of the press and is held there by a wedge. The shank of the broach (illustrated with the work in Fig. I), fits into the hole of this holder, while two plates, E and F, square the broach with the work holder, when these are properly located on the machine. Five short broaches were used for trimming out this hole from the forging size.

As a general thing, push broaching is not as satisfactory as pulling the broach through the work, and most broaching machines are based on the latter principle.

Designing the Broach

The correct design of broaches is a high-grade art, requiring good judgment, and one of the purposes of this article is to present examples and constructional details used in their manufacture and operation.

Referring to Fig. 3, the tools necessary for pull broaching a key-way are shown. These consist of a broach A and a work bushing B, while oftentimes it is necessary to make a broach holder having a substantial means for gripping the broach in the tool slide of the machine. The amount of stock to be removed by each tooth of the broach must be decided upon, and likewise in deciding the pitch of the broach teeth it must be coarse enough to allow the chips to lie in the space between the teeth, this

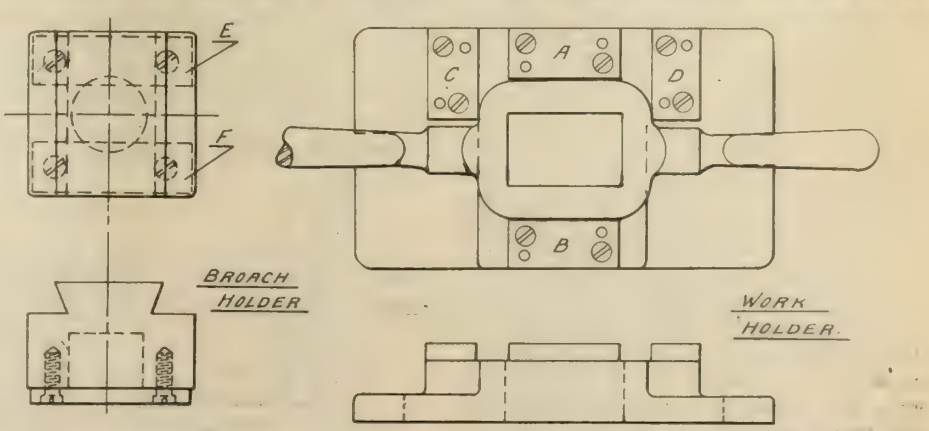

FIG .2—TOOLS USED IN CONNECTION WITH BROACHING THE PART SHOWN IN FIG. 1.

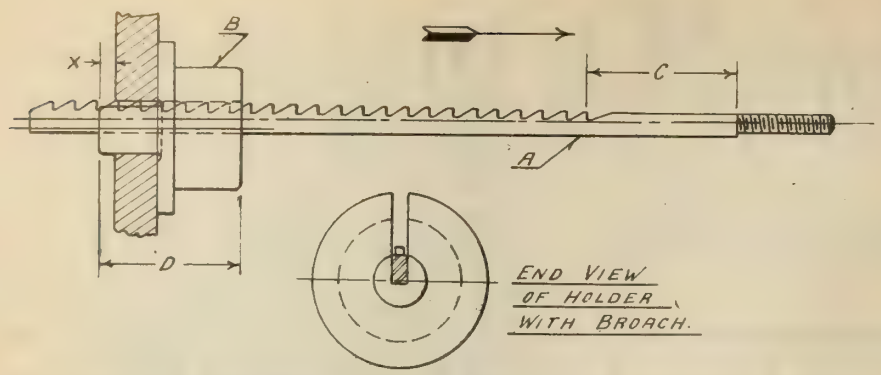

FIG. 3—TOOLS FOR BROACHING A KEYWAY, USED ON DRAW BROACHING MACHINE.

depending on the length of the work. Having determined on the broach teeth the length of the broach is governed by the depth of the key-way, but in addition to this there are two other conditions which are quite apt to be overlooked, either of which might prove fatal to the operation of the broach. The first of these is the length C, which must be added to the length of the broach and is at least equal to the length of the work bushing D. This permits the broach to be passed through the work and into the holder without the teeth of the broach interfering or coming in contact with the work. It will be noticed on the illustration that there is a distance X between the work and the end of the work bushing. The importance of this added length is often overlooked, but as a protection against broken broaches it is "insurance" at its best. The reason for this is apparent from the diagrams, Fig. 4. For if the work bushing comes flush with the end of the work, when a tooth of the broach starts to cut, there is a breaking point X directly opposite the tooth; should the work bushing be shorter than the work, the tendency to break the broach at this point is aggravated, while if the work bushing is longer than the work, as shown at the right in Fig. 4, the broach is properly backed up while cutting and consequently is not apt to break from bending strain.

A common error in laying out work which is to be broached is to assume that because a broach is listed to cut a key-way so wide and so deep, it will do it, for if the broach was designed for short work and an attempt is made to use it on long work, the chances are the broach will be broken, although the operator can not be blamed for doing what the operation list called for, and therefore lists of broaches should specify the maximum and minimum length of work for which best adapted.

Various Styles of Holders

The illustrations, Figs. 5, 6, 7 and 8 show a number of pull bushings or broach holders which are adaptable for most work, the object of these being to grip the shank or threaded portion of the broach securely, so the same may be pulled through the work.

Referring to Fig. 5, the upper views show a plain holder having a screw A with a shoe B in a holder C, which are used for locking the broach in position after it has been screwed into the holder. This holder is gripped by the large threaded end in the tool slide of the machine.

Below this is what is known as a floating holder and the portion D of this is similar to the one above, except that the shank, instead of being threaded, has a bell-mouthed hole E in it. This shank is a floating fit in the holder F, which has a pin G in it to keep the holder D in place. The holder F is attached to the tool slide of the machine and this whole arrangement makes a suitable means for allowing the broach to fit in a bushing at the work end of the machine without being rigidly attached to the drawing end of the machine, where such an arrangement is desirable. An arrangement for pulling the broach which may be used when the broach is very small and the cutting is light is indicated in Fig. 5, as "Holder with binding screw," and the construction of this is obvious from the illustration as the shank of the broach is simply flatted at H against which the screw J is caused to bear.

The illustration below this also shows a holder suitable for light work and besides the threaded end for holding it in the tool slide two pivot point screws K and L are provided, which are adjustable and hold the broach while it is pulled through the work. A good rugged arrangement for holding the broach is the wedge construction shown in this illustration. In this an elongated hole is cut through the broach and an elongated hole is cut through the holder, through these a tapered wedge is passed, from which it is almost impossible for the broach to pull away. Some very substantial broach-holding arrangements are illustrated in Fig. 6, the first of which, with the split bushing arrangement being a very simple means of securing good results, as it combines a solid pull arrangement with easy removal of the broach. It is necessary in this construction to have the distance A greater than the length of the bushing B, and the broach C is provided with a head D. In operation the two halves of the bushing are put over the shank of the broach through the hole A; the broach with the bushing in place is then pulled back until the bushing is in the hole, as shown, and takes the pull of the cut.

The view in the centre makes a neat arrangement of a substantial floating holder and is constructed as follows:

The broach E is threaded at the end and a nut F is screwed thereon; this nut has a radius at one end which comes against the screw bushing G; this screw bushing, after being screwed in place by means of the squared end, is locked by the screw and shoe H, while the holder itself, J, is held to the tool slide in the usual manner. The hole in the threaded bushing is slightly larger than the broach shank, which with the radius on the nut makes a holder having a little float.

Revolving Broach Holder

A revolving broach holder suitable for use where it is necessary that the broach revolve, as in broaching spiral keyways, has been shown at the lower part of Fig. 6. The broach holding portion proper is designated as K and the broach L is threaded into this; to prevent the broach from unscrewing out of this holder a key M is provided and a screw N forces this key down into the keyway and binds it there, thus locking the broach securely. The holding portion K has a head on it, P, which bears against a thrust washer, Q; a ball bearing, R, then takes the thrust of the cut, while the plate S holds these in place in the holder T, the plate being held in by the screws U. In pulling a spiral broach through work it is customary to cause the broach to revolve at the work end of the machine, which makes it necessary to arrange the holder so it will pull the broach and revolve at the same time, which condition is very well taken care of by the ball bearing thrust washer and the arrangement shown, while the principle involved will

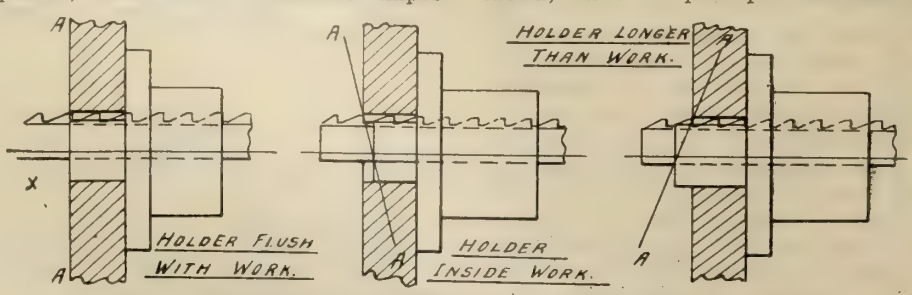

FIG. 4—THREE EVTMPLES OF WORK HOLDERS.

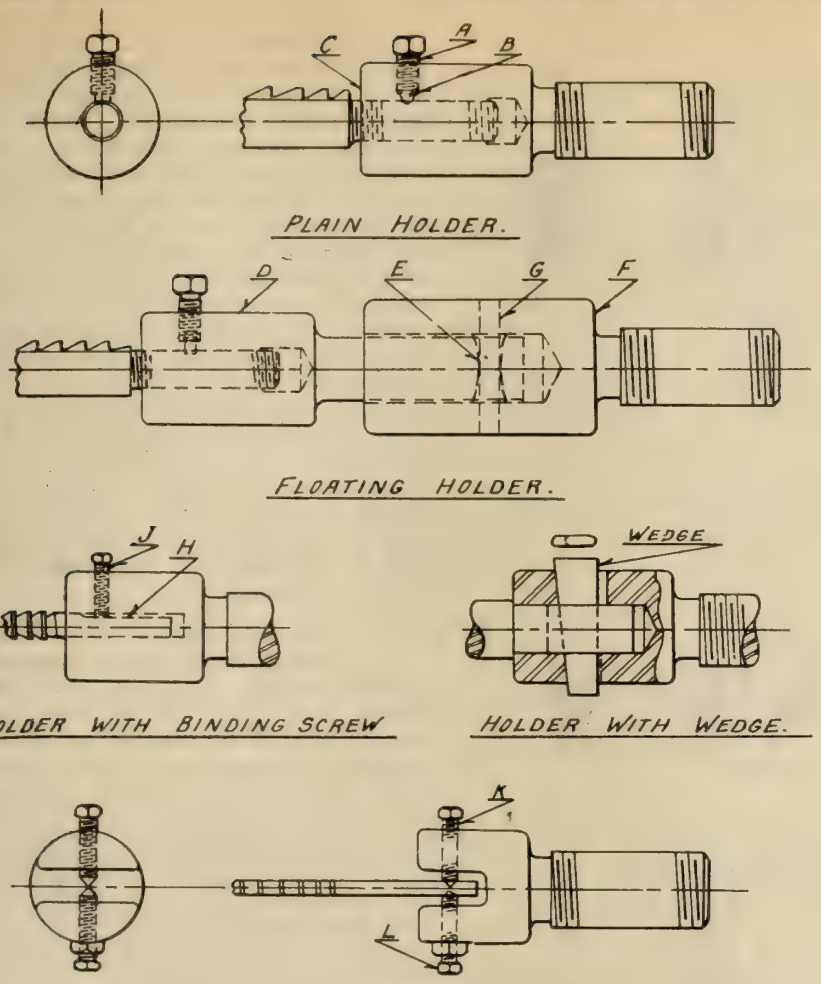

FIG. 5—A GROUP OF BROACH HOLDERS.

be illustrated in an example of spiral broaching in a later illustration.

Figure 7 shows a split pin arrangement for holding a broach and this pin is best likened to a clothes pin, as it slips over two flats on the shank of a broach in much the same manner as a clothes pin would over a line. Referring to the illustration, A is the broach, B is the split pin, C is a pin used for pulling the split pin in and out of the hole, while D represents the flat on the broach, and E the broach holder proper. In operating this, the broach is slid through the work and work bushing into position in the holder, the split pin B is then pushed in place over the flats D, where it takes the thrust of broaching.

In the lower portion of Fig. 7 a holder where the broach F is threaded directly into the holder is illustrated. This holder is split at G and ring H, with a screw J, is used to pinch this holder together and bind the shank of the broach.

Another example of a split pin arrangement is illustrated in Fig. 8, where the pin and holding means are the same as that shown in Fig. 7, except that at the closed end a spring is located in place of a pin. This spring X is made of flat stock and is used to hold the pin in place and it is particularly useful where the holder has to revolve as the spring clinging to the holder keeps it in position, even though the spring end should be on the under side.

The lower illustration in Fig. 8 shows a latch method of holding a broach while it is drawn through the work; this method, while not as rigid as some, is quick operating where the broaches have to be removed continually. The broach A has a notch B cut in it and the holder C is constructed with a cap D on it, a slot E in the holder contains a lever F, which is free to pivot on the pin G; four screws, H, hold the cap in place. Other features of this holder are the spring pin J and the binding screw K, which has a handwheel L on it, while a screw M keeps the spring N in place to operate the spring pin. In operation, when the screw K is released, the spring pin J forces the hooked end of the lever out of the slot in the broach and the broach can then be pulled out of the holder, while the reverse of this, of course, locks the broach in place.

In push-broaching the broach holder may usually be of very simple design, such as a pad to fit in the hole of a press, as shown at A, Fig. 9, which pushes the broach through the work, or the holder may have a groove for locating the broach in its proper radial position, as shown at B. For some jobs it is desirable to support the upper end of the broach in a holder similar to C, Fig. 9, while a ball bearing pad, which revolves when a spiral broach is being forced through a hole, is illustrated at D.

Work holders for broaching are, of

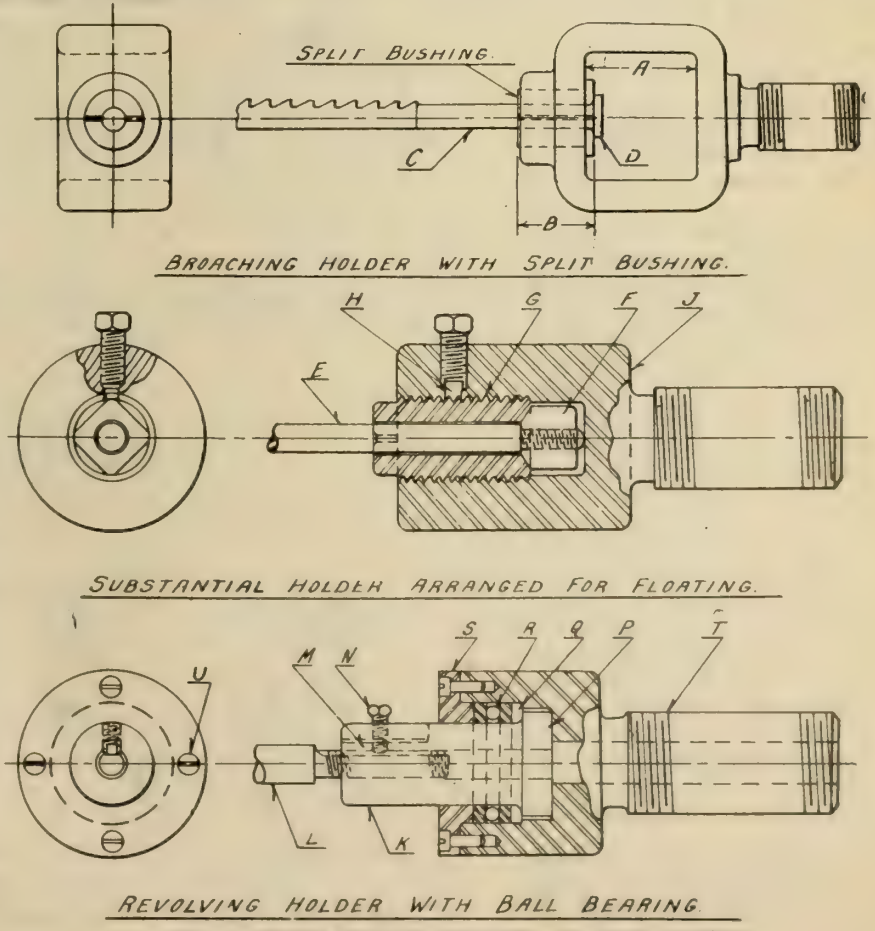

FIG. 6—THREE BROACH HOLDERS OF GOOD DESIGN.

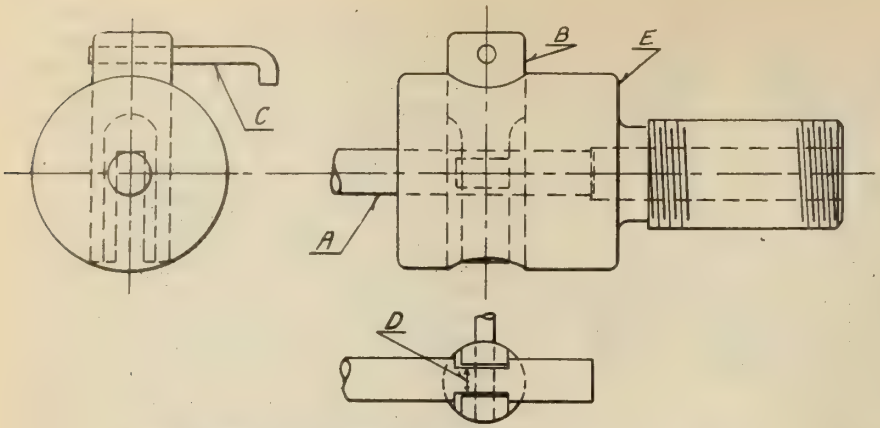
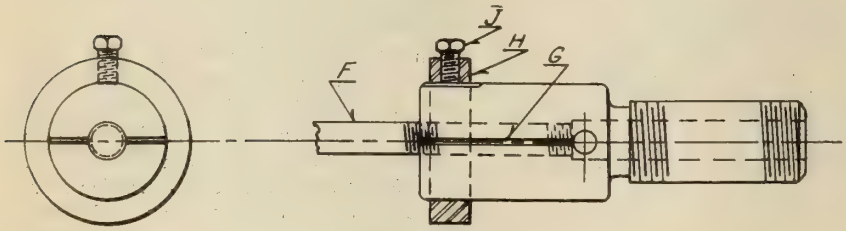


METHOD OF HOLDING BROACH WITH PIN.



SPLIT CLAMP BROACH HOLDER.

FIG. 7—SLIP PIN AND THREAD BINDING BROACH HOLDERS.

course, quite numerous, they being designed to suit individual and varied conditions, and therefore a few typical examples covering general requirements are all that will be shown here.

Basic Features Involved

The basic features of a work holder are that it must support and locate the work, guide and often back up the broach, while economical production demands that it be as simple as possible, consistent with the required accuracy of the work.

Referring to Fig. 10, the first illustration shows a work holder for broaching a plain bushing. This holder consists of portion A, which fits the machine and a stem B, upon which the work is placed, while the slot, of course, guides and backs up the broach. Where the work broached is small, this work holder is usually made in two parts, and such a holder is shown below the one just described, where C fits the machine and D holds the work. In the view at the upper right-hand corner the bushing E also has a small work bushing F inserted in it, this latter bushing being set below the centre, so as to bring the broaching tool in line with the screw of the machine. The view below this shows a bushing for broaching a keyway in a tapered hole, where it will be noticed the end of the holder G is machined so as to hold the work on an angle so the keyway will be broached in line with the hole.

The lower illustration shows a large holder, H, in which is held six small holders, J, upon which are placed six parts, while keyways are simultaneously broached in them.

In Fig. II, a complete work holder for handling the part shown consists of a cast iron portion A, in which is inserted a steel locating bushing B, while two pins, C, locate the arm, so the keyway will be broached in the proper relation to match with this arm when assembled in place. Having determined on the method of holding the work and the means of pulling the broach, the design and proportioning of the broach is the next consideration, and while a faulty work or broach holder will often break a broach, the design of the broach determines the quality of the work produced and the wearing qualities of the broach to a large extent.

In describing broaches the object will be to show successive steps in their design, as the broach cuts up to the form desired from a blanked or starting hole, and as a prelude to this reference is made to Fig. 12, which shows proportions for broaches that have been quite generally accepted.

The Teeth

As a general thing, broach teeth are undercut slightly unless they are machining very soft material, while the average pitch of broach teeth would be equal to the square root of the length of the hole multiplied by the constant 0.35, thus: $P = \sqrt{L} \times 0.35$, in which P equals the pitch and L equals the length of hole broached. There should be a large fillet at R, while D must be deep enough to give chip space for the longest hole broached, this, of course, depending on the amount of metal removed by each tooth and no general rule can be given governing this, as it

FIG. 8—PIN AND LATCH ARRANGEMENTS FOR HOLDING BROACHES.

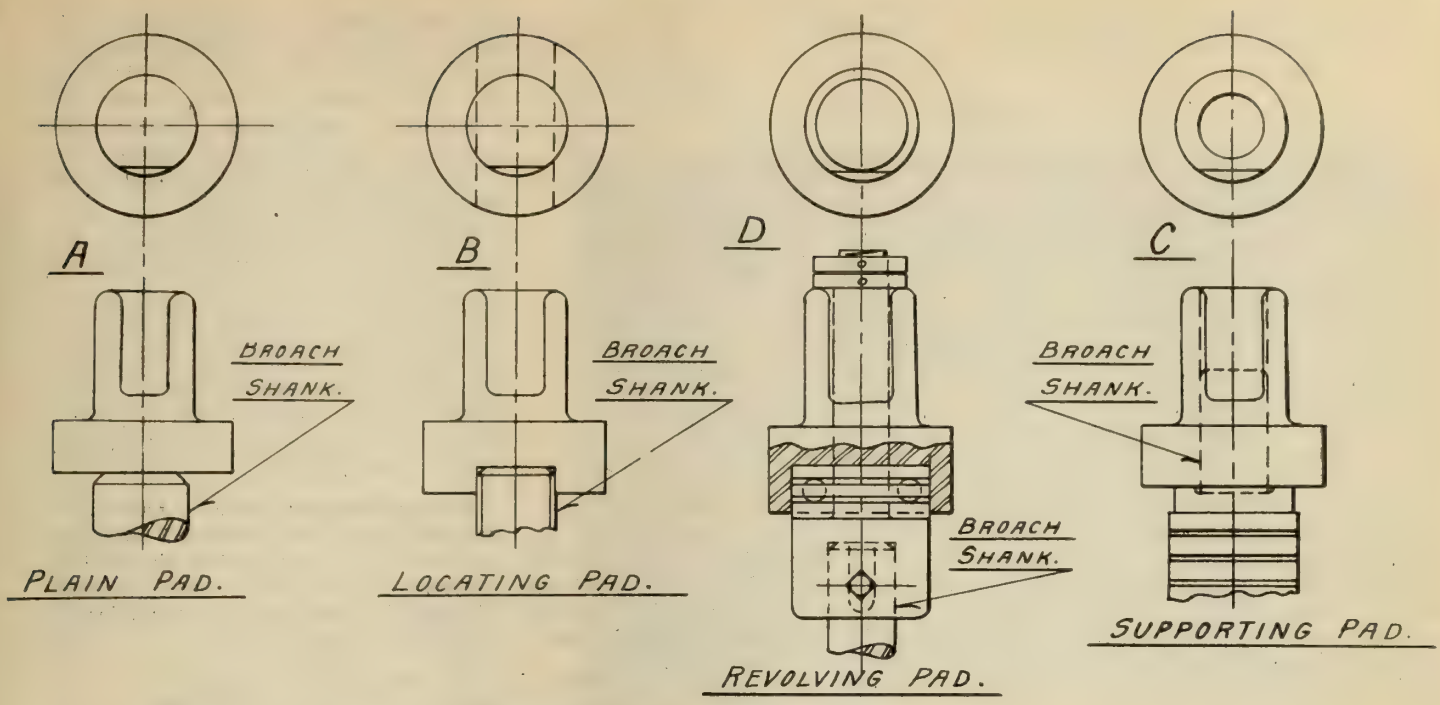

FIG. 9—FOUR TYPES OF PUSH BROACHING PADS.

will depend on the toughness of the metal, as, for instance, cast iron, bronze, soft or hard steel etc., would vary this amount and there are other conditions which will be taken up later.

The rule given above for determining the pitch of the teeth must not be unqualifiedly taken, however, for, if the teeth are too close together too much power will be required to pull the broach through the work, also the pitch should never be coarse enough to allow the teeth to straddle the work, or in other words the pitch should never be greater than the thickness of the work and two teeth should be in contact with the work at all times.

Various Broach Designs

In Fig. 13 a number of diagrams of broach design are shown, of which the first is a broach for a square hole. Considering the upper row of diagrams only, the first shows a section through the shank of a broach which enters the hole, the second shows a section part way up the broach, the third shows a section near the finishing end of the broach, while the last illustrates how the finishing teeth would look. It will be noticed in all of these views that the diameter A remains the same, while the dimension B is increased successively to square out the corners of the hole. The row of illustrations below show successive stages in the construction of a hexagonal broach, while below a typical broach drawing is shown where Y is the broach shank or holding portion, X is the starting portion equal to the length of the work bushing and the remaining portions describe how the teeth are to be proportioned at various parts of the broach. The design of a broach is largely a matter of experience, and Fig. 13 simply gives an idea of what this experience leads to. A broach designer will try to have all his working teeth do an equal amount of work, therefore as a broach starts to cut out a square from a round hole the teeth will be working on a greater- radius at the start than

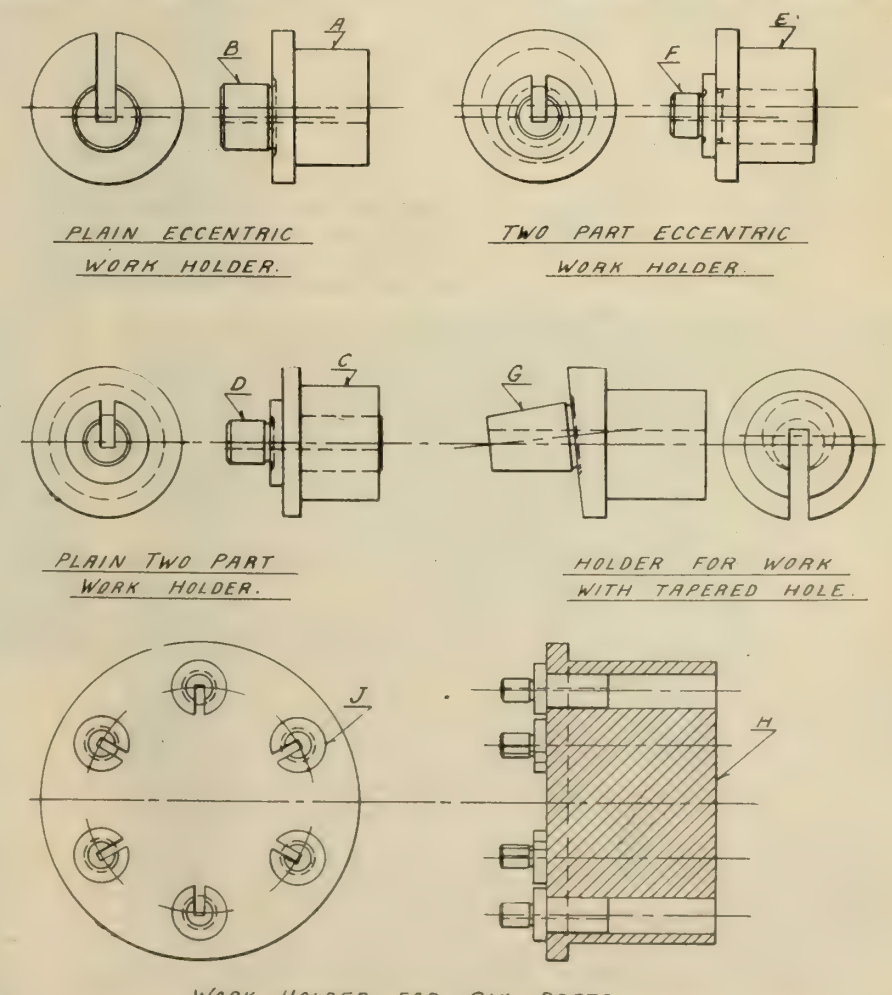

FIG. 10—A GROUP OF SIMPLE WORK HOLDERS.

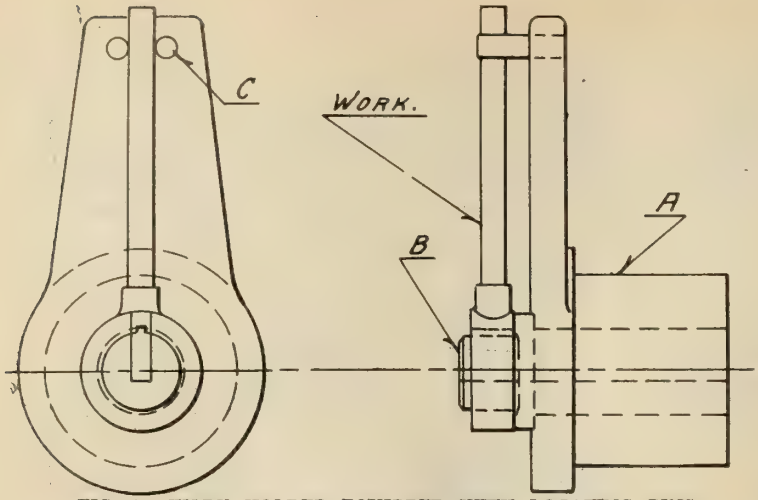

FIG. 11—WORK HOLDER EQUIPPED WITH LOCATING PINS.

when part way up the broach, as indicated at C and D in the upper illustrations. To counteract this the teeth which first start to cut on the broach are made to take lighter cuts as regards depth than those further along, as will be noticed from the notes, .002 rise, .003 rise, etc., on the lower illustration, while a number of teeth at the end of the broach are made equal rise in order to maintain the size. Various shaped broaches require different treatment in this regard, and no general rule can be given which would cover this phase of broach design.

Among the features often met in pull broaching are two or more parts being broached together by placing them one against the other, or a number of parts will often be broached simultaneously by grouping them on a suitable work plate and using a group of broaches. On some classes of work broaching is supplanting reaming, as it is claimed that the broach will hold its size for a much longer period than a reamer, will make straighter holes and smoother holes at increased production.

Broaches are also used to some extent for correcting inequalities caused by the hardening of some parts; the practice in such cases being to pull a broach slightly larger than the hole required through the work after hardening. The broach in this case has no teeth, the operation being one of compressing the metal and a lubricant is, of course, used at this time to prevent tearing the metal.

Another type of broach used for enlarging holes in soft material instead of reaming is made up with a series of spaces and steps, which are rounded slightly on top and highly polished; these are forced or drawn through the work and compress the soft metal, thus forming a glassed surface, which is oftener superior to reaming on soft white metal, babbitt, bronze, etc.

Having dealt at some length with general details of broach construction and operation in the next section of this article, reference will be made to types of broaching machine and examples of broaching practice.

Vancouver.—The shipping interests of Vancouver are petitioning the Dominion Government to construct a floating drydock here. While it is felt that a permanent drydock would be more desirable, the cost of construction and the time required would be much higher than for a floating dock. The latter could be built and finished in about a year, while a permanent dock would require about three years at the least.

A new high-speed steel known as chrobaltic alloy, which can be cast into intricate shapes, is mentioned in the "Iron Age" as being used as a substitute for tungsten and vanadium steel by a Chicago company in the manufacture of milling cutters and other tools having multiple cutting edges. The castings have the appearance of smooth forgings and are said to be practically non-rusting and acid-resisting, and the heat-resisting qualities of the alloy are such that it does not scale in the fire, thus adapting it to milling cutters having thin edges. The steel may be hardened in oil or air, and it is explained that the processes of annealing and rehardening may be repeated without the steel losing any of it properties. Annealing is effected at 1832 deg. Fahr. in a closed muffle. Cooling is allowed to proceed slowly.

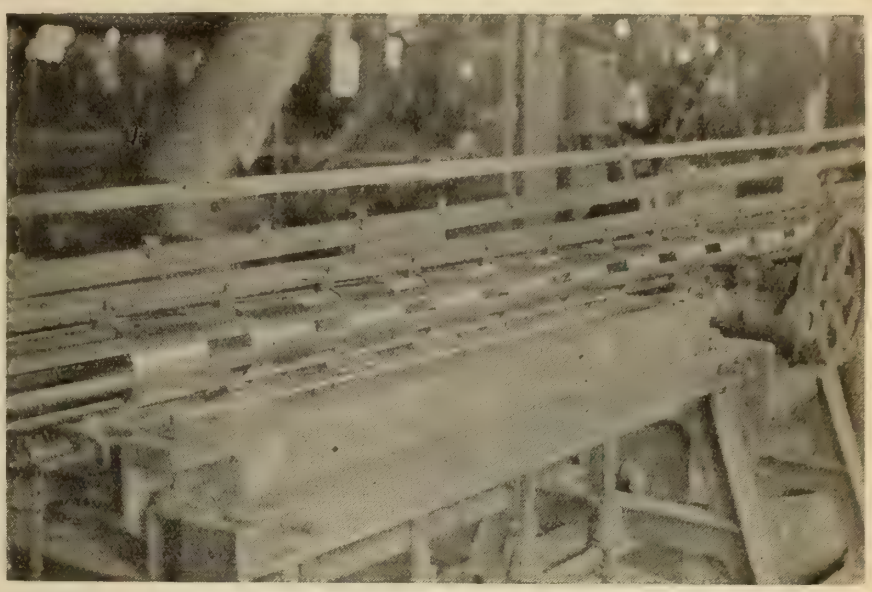
Various Conveyors Used in Canning Industry

By J. H. MOORE

CONVEYORS to right of them, conveyors to left of them, volleyed and thundered, could well apply to the plant of the American Can Co. of Hamilton, Canada, who, as readers well know, manufacture almost any size and shape of tin can, and a considerable variety of paper can as well.

In work of such nature it is absolutely imperative that the work proceed at a regular gait from operation to operation, until the completed can, so that conveyors form a large part of this plant's equipment.

To show by photograph all these conveyors would take a volume. There are all sizes and types to be seen on every side, some in the form of endless belts, while others take the shape of chain conveyors. Then there is the ordinary chute style, down which the cam comes from either some other machine on the same floor, or on the one above. These conveyors even go out direct to the cars which are loaded at a surprising rate of speed.



THE CHAIN TYPE OF CONVEYOR USED FOR PULLING CANS THROUGH SOLDERING TANK.

FIG. 1—WIRE LEAF CONVEYOR USED IN CONJUNCTION WITH PRINTING PRESS.

In addition to these various style cans, this firm manufacture shoe polish boxes, which are first of all lithographed in their flat state before being stamped and drawn, or punched into shape. These lithographed sheets go direct from the press to a drying oven by means of a novel conveyor, which is illustrated at Fig. 1.

This conveyor is made up of rod iron compartments or shelves, which keep each sheet of lithographed tin away from the other. The complete arrangement moves slowly through the drying oven, and on reaching the other end is dry and ready for handling. The girl placing one of these sheets in position shown in the photograph needs no comment since the action is self-apparent.

At Fig. 2 we illustrate the chain type of conveyor. This chain has a series of lugs on it which come in contact with the cans, pulling them through (at correct speed) the soldering tank. On reaching the other end of the machine they are soldered down the vertical seam and pass on to the next operation.

Last, but not least, we illustrate the common or garden variety of chute. Readers will note the close proximity of the two chutes A and B. This is one

The Terrific Punch of a Small Boiler

Explosion in Small Shop Where Vulcanizing Was Done Opens Up a Question of Interest—Terrific Power Released Does Great Damage

By T. H. FENNER

IF there are still sceptics on the subject of the dangers of small vessels containing water and steam under pressure and temperature conditions it is surely not through lack of object lessons.

The latest of these demonstrations occurred in Toronto very recently, much to the detriment of the building in which it occurred. Fortunately, or we might say, almost miraculously, it was not accompanied by any loss of life or limb. The case referred to was the explosion of a small cast-iron vessel used for vulcanizing automobile tires, and it was situated on the second floor of a garage and service station on Jarvis Street, Toronto.

The apparatus consists of a cast-iron vessel of square cross-section in the lower part, the upper part being made a semi-circular shape, to conform to the shape of the tire. There are three sections, so that three tires can be handled at once, and the vulcanizing is performed by the heat of steam circulating round the inner surface of the moulds. This steam is generated from the water contained in the lower portion of the apparatus, and the necessary heat is applied by a gas flame on the bottom. The lower part, which is practically a cast-iron boiler, is filled with water through a funnel, and holds probably 50 lbs. of water. After filling, the funnel is removed and the hole plugged. A safety valve set to blow off at about 40 lbs. per square inch, and a steam gauge are fitted.

Where the Valve Stops Work

The pressure used will, of course, never exceed the pressure at which the valve is set, unless something prevents the valve from working. Evidently something of that nature happened in this case, for while the attendant, fortunately for himself, was temporarily absent, an explosion occurred. The result was the complete demolition of the vulcanizer itself, the shattering of every window on the second floor, and the splitting of the front wall of the building from top to bottom.

A very respectable effort for a couple of pails of water, was it not?

As a bystander remarked, one would wonder how such a little thing could do such enormous damage. However, a little study will dispel the wonder, and probably bring home to many more or less complacent users of boilers the nature of the forces they are handling.

We may fill a boiler, or other vessel, with water and then, by means of a pump, produce pressure high enough to rupture the tank. No explosion happens. Why? Because there is no latent energy contained in the water to cause one. The vessel ruptures, and the pressure disappears. The energy contained in the water has been used up in overcoming the resistance of the material to rupture. That is why testing of boilers is always done by means of hydraulic pressure. Water being practically incompressible, a stroke or two of the pump is sufficient to increase the pressure after the vessel is once filled.

But When Heat is Applied!

Now, let us take a vessel, and partially fill it with water, which we proceed to heat, until some of it evaporates, and steam is formed. Instead of the water possessing no latent energy it will possess an enormous amount. To raise one pound of water one degree requires one heat unit, and this heat unit represents the same amount of work as the raising of 778 lbs. one foot high. In other words, the heat unit, known as the British Thermal Unit equals 778 ft. lbs. Now, to change one pound of water at 40 degrees Fahrenheit into one pound of steam at 40 lbs. per square inch gauge pressure requires approximately 1,161 B.T.U's, equivalent to 903,258 ft. lbs., or energy sufficient to raise 1,000 pounds 903 feet high. Now, to come back to our little vulcanizer, which seemed so small as to be harmless. Assuming it held 50 pounds water, and 10% of this had become steam at 40 lbs. per square inch gauge pressure. We would have 5 lbs. steam containing 5,805 B.T.U's. We would have 45 pounds of water at 40 lbs. pressure, the temperature corresponding being 285°F.

Let's See Just What Happens

As the initial temperature of the water is taken at 40°, the quantity of heat in the water would be $45 \times (285-40) = 45 \times 245 = 11,025$ B.T.U. Now, we can neglect the energy lost in breaking the vessel, as we have no means of estimating it, and we will assume that all the energy of the steam and water is available to do its worst to whatever obstructs it. Steam occupies, roughly, 1,600 times the volume of the water from which it is formed at atmospheric pressure. The first thing that happens when the vessel breaks is the reduction of pressure. Now, the water, which is at a temperature of 285° at 40 lbs. pressure, is considerably above the temperature of steam at atmospheric pressure. Therefore, a considerable amount of water will become steam, and will want to increase its volume 1,600 times when it does so. Let us see how much. We have available altogether $5,805 + 11,025 = 16,830$ B.T.U's. Each pound of water in becoming steam at atmospheric pressure will absorb 966 B.T.U's. Therefore, 16,830 divided by 966 will give us the amount of water that becomes steam at atmospheric pressure, roughly, 17½ lbs. One pound of steam at atmospheric pressure contains 1,146 B.T.U's. and 17½ lbs. contains 20,055. All this heat energy is available to remove anything that wishes to prevent the expansion.

See What We Have Now

Translated into foot pounds, the energy is 15,602,790. That is, enough to raise 7,800 tons one foot high, or 1 ton 7,800 feet high. The volume of 17½ lbs. steam at atmospheric pressure is 460.25 cubic feet. That means that in order to occupy that volume that much air had to be displaced, and anything that tried to confine it had to go. Luckily there were plenty of windows, which yielded easily, but not enough, as witness the broken wall. It is no wonder that the place looks as though it had been struck by a shell.

Do not despise the boiler because it is only a small one!

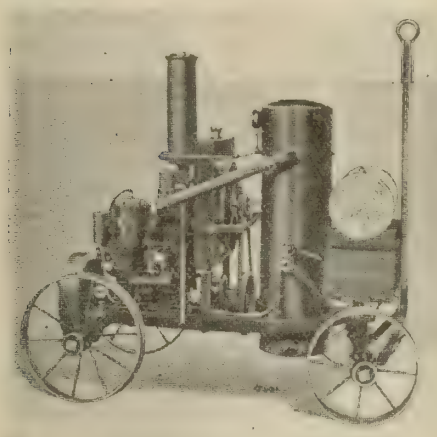
TEN times as much alcohol to be used under prohibition than formerly. This is the prognostication of a member of the American Chemical Society, at a symposium held on the question of alcohol. However, this quantity will not be made up into seductive cocktails, or sympathetic gin rickies. It will be used to propel vehicles, boats, and other power-users when the petroleum supplies become less. There are a number of new sources for the supply of alcohol, one of them being the nippa palm. This palm yields about 15% sugar, which can be fermented. This source alone would give 50,000,000 gallons of alcohol a year.

Some New Styles of Compressing Machinery

By A. W. SWAN

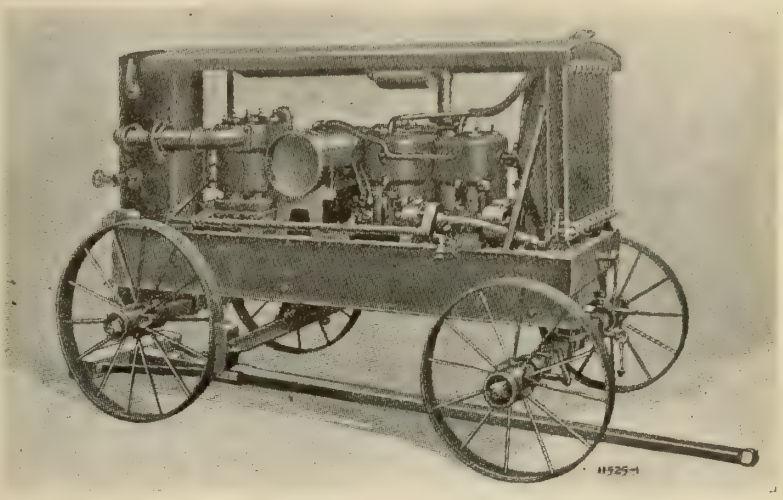
THE Ingersoll-Rand Company has recently added to its large line of air compressing machinery a light-weight portable gasoline engine-driven unit built in three sizes, known as the "Imperial Fourteen" portable compressor, the "Imperial Junior" compressor and the "Imperial Baby" compressor. These are of all steel construction, the larger sizes being provided with steel canopies or housings for protection against the weather. The power plant of the largest machine, consists of a high speed gasoline engine driving a vertical duplex compressor, while in the "Baby" a single cylinder vertical compressor driven by a single cylinder two-cycle engine is used.

The largest machine has a capacity of 210 cubic feet at 100 pounds pressure to the square inch and weighs 6,000 pounds, while the "Junior" has a capacity of 118 cubic feet at the same pressure and weighs 4,000 pounds. The "Baby" weighs 1,500 pounds and displaces 45 cubic feet at 90 pounds to the square inch. The gasoline motor provides an economical source of power and tends to simplify the mechanism to such an extent, that it may be safely entrusted to a laborer of average ability, who has a slight knowledge of gasoline engines. Such men are at present readily available and make excellent operators for an outfit of this type.



BABY IMPERIAL PORTABLE AIR COMPRESSOR.

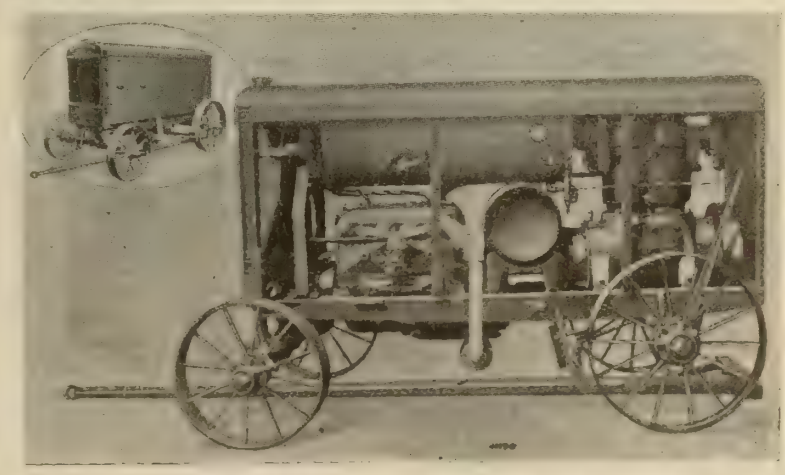
The larger compressors have both cylinders cast en bloc, with heads, valve chambers, and water jackets integral, while the smallest size is fitted with a removable cylinder head. Plate inlet and discharge valves are used on all three sizes, located directly over the cylinder bore, with the exception of the "Baby," in which the inlet valve is located in the top of the piston. The crankshafts and connecting rods are drop forgings. The compressor pistons are fitted with three-piece rings and in addition with an oil wiper ring, which returns surplus oil to the sump in the crank case and obviates any difficulty which might be caused by the air carrying an excessive amount of oil into the receiver. All bearings are die castings of antifriction metal and are adjustable for wear. Access to the main bearings and those of the crank pins is provided for by means of conveniently located handholes in the crank case. All working parts are lubricated by splash from the oil reservoir in the lower part of the crank case, with the exception of the smallest size, in which the main bearings are lubricated by compression grease cups, and the compressor cylinder by a sight feed lubricator placed on the intake. The starting crank is located at the front of the machines under the radiator.



IMPERIAL JUNIOR COMPRESSOR.

Both the compressor and driving motor are water cooled by a circulating system with a centrifugal pump, large radiator and powerful blast fan. A point worthy of particular notice is the fact that, except in the case of the smallest machine, the radiators are made up of a number of removable sections, a type of construction which allows a damaged section to be removed and repaired without taking off the entire radiator, or putting the outfit out of commission while repairs are being made. Each unit is equipped with an automatic intake unloader which maintains a constant pressure in the receiver and permits the motor to be started easily. The receivers are tested to a Hydrostatic pressure of 300 pounds to the square inch, and are fitted with safety valve, pressure gauge, drain cock, and two service valves, to which the air supply hose line may be attached, with the exception of the "Baby," on which only one service valve is mounted.

An interesting feature in the construction of the smallest machine is the use of a two-cycle motor in place of the single-cylinder four-cycle motor usually



IMPERIAL FOURTEEN PORTABLE COMPRESSOR.

found on machines of this class. Through the employment of the two-cycle type, the machine is more thoroughly balanced in regard to both reciprocating parts and power impulses than would be possible were a four-cycle single cylinder motor used, and the increased weight and cost of a multi-cylinder engine are eliminated.

The absence of valves in the combustion chamber and their accompanying cams, push rods, and tappets, simplifies the motor to a large extent and contributes in a large measure to the reliability of the equipment in the hands of men with little or no experience with gasoline engines. A double throw crankshaft, common to both the compressor and the motor, suspended in three bearings—formed by bolting the crank cases together by means of a distance piece—does away with all external couplings and provides an efficient and compact unit.

The largest compressor is driven through the medium of a fibre-faced cone clutch (controlled by a crank outside the truck frame) which delivers power from the motor to a transmission shaft carrying a case-hardened chrome vanadium pinion engaging with a hardened steel gear pressed on the compressor shaft, while in the "Junior" the fly-wheels of both the compressor and motor are placed in line and connected by a number of steel pins passing through holes bored in each fly-wheel, making a strong and positive coupling, which can be readily taken apart.

The method of mounting the machines is worth attention, particularly the swivelled front axle, which moves freely in both a horizontal and a vertical plane. This arrangement, together with the rigidly attached rear axle, gives a three-point suspension and permits the outfit to be hauled over very rough ground without any racking effect on the alignment of the power plant. When the fuel tank has been filled, lubricating oil provided, and the radiator supplied with water, the outfits are all ready for use. In the larger sizes they are adaptable to a wide range of service in engineering and construction work, such as operating a number of rock drills, portable air hoists, pneumatic drills, chipping, riveting and caulking hammers, drift bolt drivers, pile hammers, tie-tampers, wood borers, etc., while the smallest outfit may be used to operate one or two air tools, or for cleaning electric motors and machinery, sand blasting, spraying paint, whitewish or other liquids, and many other odd jobs around the power station and industrial plant.

Mrs. Bensonhurst: "When he's calling him into the house, do you mean, or chasing him out?"

ARC WELDING MAKES GOOD

By Robert E. Kinkead

Considerable savings may be effected by welding defective castings, according to Robert E. Kinkead, in a paper presented at the annual meeting of the American Foundryman's Association in Philadelphia, Sept. 29 to Oct. 3. In describing methods of welding castings, the author calls attention to the fact that electric arc welding has been used in steel foundries for about ten years, and during that period the sentiment toward salvaging defective castings has changed in a most remarkable manner. The repairing of defective castings by arc welding is said now to be standard foundry practice. The paper continues, in part, as follows:

The field in which the metal electrode process is best applied is in dealing with small steel castings where the defect is of minor importance and in larger castings where the defect occurs in a section which is thin, and on which the heat must be extremely localized.

Good foundry practice indicates that steel castings which have been welded by the carbon electrode process should subsequently be annealed to relieve any local internal strains which may be introduced by the application of the heat of the arc. There are occasions, however, when it is extremely inconvenient and expensive to reanneal a casting which shows a slight defect. On such occasions the application of the metal electrode process, owing to the very great localization of the heat, will permit the correction of the defect without the necessity of reannealing.

Until recently 5-32-inch diameter metal electrode was as large as was ordinarily used in this work. Investigations have recently shown that ¼-inch electrode, and even ⅜-inch diameter rod, may be used in the metal electrode process to good advantage on steel castings.

The welding of malleable iron castings is difficult. The most important application of the metal electrode welding process in malleable castings is in the plugging of sand holes in castings which are to hold oil. A large number of the castings encountered in automobile work are of this nature. The welding on malleable iron is always done after the casting has been annealed. If the casting is to be machined at the point at which the weld is made it should be reannealed.

There are two classes of work which can be done in the gray iron foundry with the metal electrode process. In the first class are large castings which come from the sand with shrinkage cracks or low spots in parts of the casting which are not to be machined. In the case of a crack, it may be opened up by a chipping tool, and steel filled in to give a measure of strength and complete pressure tightness.

The welding can be handled with a low current, and should not be done continuously. The operator should weld for possibly 20 per cent. of the time; the remainder of the time being divided up into intervals to permit the heat to be distributed throughout the locality of the weld. This practice will not harden the cast iron in the vicinity of the weld with the exception of the iron which is within 1-16-inch of the line of fusion. The steel added will not be hardened by the absorption of carbon from the cast iron for a distance greater than 1-16-inch from the line of fusion. If the welder works intermittently he will avoid having the steel shrink away from the gray iron. The difficulty in machining such a weld arises from the hard area 1-16-inch on either side of the weld.

The second class of work which can be done with the electric arc on gray iron is in the correction of small sand holes and sand spots on surfaces which are to be machined. In work of this nature the sand hole is opened up and a nickel electrode fused into the hole by the heat of the arc. The nickel is not welded to the cast iron, but at the high temperature produced by the arc makes an intimate contact with the gray iron, which resembles an amalgamation. The nickel is then peened and the excess metal filed away. The job may be made pressure tight, and the application is entirely successful in the correction of sand spots in the bore of engine or pump cylinders. This process is not used for the repair of breaks in a casting, but is merely a method of plugging a crack or sand hole.

According to the "Weser Zeitung," Dr. Armo Relizi of Danzig and Dr. Walter Geister intend to start on an Arctic expedition by airplanes. The purpose of the expedition is to make topographical, oceanographical and meteorological surveys, and to test the value of aircraft in the Far North. The expedition will start from a vessel going as far north as possible, which will serve as the base for the operations which will be conducted north of the 58th degree of latitude. The machines will be biplanes of two types: light scouts of great speed, and heavy machines for the expedition proper. They will be fitted with floats with flat bottoms to enable them to land on water and on ice.

There is an electric light and power company located 200 feet from the Patapsco River, near Baltimore, Md. A cableway carries coal from the river to the power house and coal is also stored in the space between the power house and the river bank. Recently the power company started the erection of a new hoisting tower and bridge to handle coal, but the weight of the stored coal had started a movement of the ground toward the river and it was realized that the construction of the tower foundation in this shifting ground would be carried on with difficulty. It was decided to sink caissons at an angle so as to allow for the movement of the ground and this was done by suspending the caissons from a timber framework by means of cables. By letting out certain cables faster than others the desired tilt was obtained. After the caissons had

been carried down through the shifting soil (a distance of about 50 feet), they were brought to plumb and the excavation proceeded under air through a twenty-foot layer of sand to hard bottom.

TWIST DRILL BREAKAGES

A writer in an Old Country publication has the following to say on the breakage of twist drills: "With the increasing use of twist and fluted drills in the small repair shop and the ironmongers' workshop, come a greater number of complaints concerning the frequency of drill breakages. One such shop I know had, as a matter of fact, all but decided upon a discontinuance of their use, and averred that what was gained in point of drilling speed, was more than lost by the extra cost of twist drills over the flat-lipped kind, which could be made to any size and by any ordinary mechanic. I looked into the matter at the wish of the firm in question, and found that high as was the breakage list, the cause could be traced almost wholly to the conditions of the machines, and to the—yes, I must say it—to the ignorance of the men who operated them. In the first place the drilling machines were, I found, in an execrable condition, the spindles had a deal of lateral play in the centre bushings, and endwise the wear was such that the spindle could be lifted vertically a distance of more than ¼-inch. Most of the drill disasters occurred at the point where the drill is just breaking through the metal; this being attributable to the sudden drop of the spindle and the drill being forced to clear out too great a portion of metal. Then spindle looseness also permitted the drill to wobble unduly in the hole, and reduced stiffness, thus putting abnormal strain upon it. Further, I found that drill grinding was such a slovenly, unscientific operation that a deal more pressure than was necessary had to be exerted in order to make it cut. Incorrect and unsuitable rotative speeds were also a factor entering largely into the question of excessive drill breakages."

The Mournful Wail of an Old-Time Planer

By ITSELF

I AM a planer. True, I should not be ashamed of that fact, but I am an old planer, which explains the reason for my confession of shame. My more up-to-date brothers lord it over me every day of my life. Merrily their tables go back and forth eight hours each day, while I stand in a poorly-lighted corner, sometimes for a week at a stretch, receiving no material to work on whatsoever. It is on such days as these that I feel especially blue.

About an hour ago I felt that at last a real job was coming my way. The plant engineer was discussing with the superintendent the advisability of placing a certain piece of work on my bed. "Take no chances on that old contraption," said the plant engineer, "but put it on No. 39." This No. 39 spoken of is a big planer two machines up from me, in fact one of my worst enemies, for he is working day and night, purring to me all the time in an oily tone, "Oooooooh—go do some work."

I tried to attract their attention by rattling my pulleys, which are somewhat slack, but they paid no heed and continued their conversation.

The plant engineer was again talking. I listened closely. "You know, John (that was the super's name) I'd toss that old bird out on the scrap heap if I were you." Scrap heap! I fairly shook with rage, and rattled my pulleys in such alarming fashion that they both looked around as if actually afraid I was about to fall on them.

"I'll admit she's a little old," remarked the super, in answer to the former suggestion, "but I hardly think she's ready for the scrap heap yet."

Would that a planer had the power of speech! I felt like blessing that super., who still remained my friend—but what was this?—he seemed to be still talking.

"As I said before, she's not yet ready for the scrap heap, but mighty near it, I'll admit. Bill Smith tried a job on it a week ago, and would you credit it, he claims that the noise from the thing nearly deafened him."

The traitor! Once more I shook with rage. This time I must have rattled worse than usual, for they both looked at me, and then looked at each other.

"Guess you're right," said the super, finally, "she's about done for. I've rebabbitted those bearings about 140 times it seems to me, but she is all shot; out she goes after the shop shuts down on Saturday."

They moved off with this final decision, which was practically the same as the judge's final decision regarding any murderer.

I am no murderer, although I have heard some smart chaps around the shop say I murder any job I ever get—still I'm asking for a reprieve. I'm rattling worse than ever these days in order to attract attention to the fact that I firmly believe I'm not receiving a square deal, but all they do is laugh at me and say: "Thank goodness, she's going at the end of the week."

It is now Friday night, and the time grows near when I'll be merely a portion of the scrap heap. Who can tell but what my bed will be lying amongst some dirty, broken-up junk, while my framework is being broken up by some fool with a sledge, with nothing else to do but pound at me.

Would that I could tell machinists in general to be kind to the old-timers who worked for you so faithfully before these new fandangled machines came into being! Why not show us old-timers at least some consideration, even if it is only an odd job now and again? Still I suppose we must make room for the new blood. The space we occupy on the floor is even grudged us, so its off to the scrap heap for us.

I was moved to-day to the scrap heap, and it's just as I suspected. They took my bed away from me. They even took away my innards and placed them elsewhere, leaving only my framework. I felt positively naked. Then along came the chap with the hammer; not a mere sledge as I expected, but a huge magnetic affair, which was taken to a great height, then released.

Oh, could I but describe my feelings when I saw that weight coming rushing towards me! This was worse than I had ever dreamt of in my wildest moments.

Crash—It had reached me, and oh, I feel so weak now that I'm afraid I will not be able to speak much longer!

They have lifted the weight once more. Down it comes ————. I'm ruined now. I'm in at least a dozen pieces. Goodbye friends, I'm a gonner; no longer a planer, but just a part, yes, just a part of the scrap heap.

According to the United States Geological Survey, shaft 3 of the Tamarack Mine, Houghton County, Michigan, is the deepest mine in the world, with a depth of 5,200 feet. Other shafts of the Tamarack and of the Calumet and Hecla Mine in the Lake Superior region reach depths of between 4,000 and 5,000 feet. Three shafts of the Prizbram silver mines, Austria, have penetrated to depths of 3,300 feet. The Victoria quartz mine, at Bendigo, Australia, is 4,300 feet deep, and a number of shafts in the Transvaal gold region have been sunk to depths of nearly 4,000 feet.

VARIOUS CONVEYORS USED

Continued from page 525

feature which makes such chutes so handy as the space they occupy is not only small but they can be placed almost in any position.

This article is not an attempt to cover the conveyor problem, but rather just an illustrated talk on some interesting methods employed.

WHAT OUR READERS THINK AND DO

AN INTERESTING RADIUS PLANING TOOL

By J. H. Moore

The writer on a recent editorial visit came across a very efficient planer or shaper tool, which he believed would interest our readers, so he photographed the tool by itself, with the result shown in the picture accompanying this article.

The tool, while crude in some details, accomplishes the work very nicely, and after all, it is the idea that we offer to the reader.

A general glance shows the tool's construction, the portion A, being the stationary member of the tool. B revolves inside A, by means of the following motion:

The handle C, operates a worm, (not shown) which is at the back portion of the tool. This worm in turn operates a gear fastened to B. This, of course, turns B around in a complete circle if necessary.

The majority of work done with this tool is the planing out of various dies of different radii, and the completed work is very accurate and satisfactory. Of course, the handle C, is turned by the operator at whatever speed he desires.

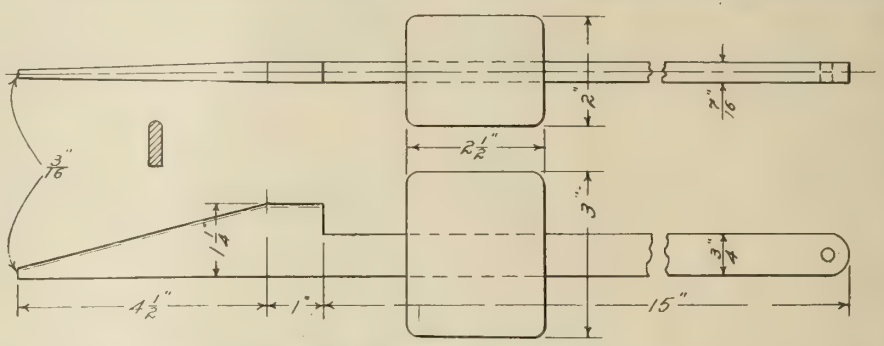
Depending on the radius required, the tool D, is set out—or in from the centre, and the distance from the centre to cutting edge of the tool being the vital point. This feature allows such a tool a wide range, and a attachment of such a nature as described is a mighty handy thing to have around.

NEW STYLE DRIFT KEY

By A. C. McALPINE

How many drill operators, when asked, can immediately lay their hands on the drift key belonging to their machine? The first time you are through the shop just try and see. When there are two shifts the day man generally locks this kind of tool in his cupboard, with the result that the night man loses all kinds of time searching for substitute. There is also the danger of men using files for this purpose, and a good many eye acicdents have been caused by this practice.

The writer of this article stopped at one of the "drills" in the shop to get the thickness and taper of drifts in use and on asking the operator for his drift was quite three minutes in getting it, owing to it being under a pile of drills and other tools. The following device will eliminate this waste of time and is in use at the Canadian Pacific Railway Angus shops. A steel drift is made according to sketch attached. This drift is made tapered on the flat as well as the edge, so that it can be used for all sizes of drills. To this key is welded a piece of mild steel, 15 in. x ¾ in. x 7-16 in., on which a cast iron weight is made to slide. The drift is applied in the usual manner and the weight thrown up to it, giving a blow similar to a hammer blow. Thus you have a drift key and hammer in one tool. A good long chain is attached to this device and fastened to some convenient part of the machine.



DETAIL OF THE DRIFT KEY.

THE EYE AND THE OXY-ACETYLENE FLAME

In commenting on a Government publication on eye protection, Professor Koppins, of Chicago University, says: "There is no doubt that in using the oxy-acetylene flame, and looking at it with the eyes unshielded, the condition is not normal, and some sort of disturbing effects result. Outside the volume or intensity of light, which is a personal matter, since some people feel perfectly comfortable in light of a certain intensity which would make other people feel

GENERAL VIEW OF THE TOOL.

uncomfortable, there is the question of short light waves coming. Normal eyes are so constructed that they can only perceive the light which is contained between rather narrow limits, that is from the longest red to the shortest violet. The longer waves are heated waves, and do not affect the eye in any other way except in intensity, but the shorter waves are the dangerous ones, since they are the chemically active rays, which will affect the eye on that account besides on account of their intensity. Just what the effect is depends upon the intensity and length of exposure. A relatively short exposure causes burns on the skin such as are caused by the sun, in fact sun burns are produced by the short rays in the sun light. Prolonged exposure would, of course, cause more severe burns, and since, of course, the operator usually takes precautions when he is warned, the extreme effects are not known. It is safe to say, however, that the result is similar to that caused by X-ray burns, which, of course, are much more severe, and have cost the lives of careless operators.

Regarding eye strain, that depends upon whether or not the person who wears correct goggles should have any bad effects due to the ultra-violet light. Of course the goggles should be so constructed that any extraneous light cannot enter at the sides, since the sudden change in intensity would undoubtedly strain the eyes.

TORONTO SECTION A.S.M.E. MAKE PLANS FOR THE COMING WINTER

Increased activities in the various branches of the engineering profession and the need for more recognition, to some extent influenced the programme outlined for the ensuing season at a dinner held in the Engineers' Club by the Toronto Section of the American Society of Mechanical Engineers, on November 14. Shop visits will be made to various plants in Toronto and vicinity, informal dinners will be held, and papers of a character calculated to ensure an increased attendance will be read.

A strong effort will be made to increase the membership in this particular section, and it is expected that, with the large body of mechanical engineers resident in Ontario, the Toronto Section will become one of considerable influence.

Brigadier-General C. H. Mitchell addressed the meeting and gave some very interesting reminiscences regarding the mechanical phase of the war both in France and Italy. The Italian power stations, all hydro-electric, had greatly expanded since last seen by the speaker, some years previous.

REMOVING BROKEN TAPS

A tap, broken off in a hole, is often very troublesome to remove, and sometimes it costs less to throw away the part than to remove the broken piece with ordinary means. But the oxy-acetylene torch makes the job easy. The flame, directed against the end of the tap, will heat it so quickly that, generally, the sudden expansion will push back the walls of the tapped hole sufficiently to loosen it when slowly cooled off. If heating alone in this manner does not prove effective it will at least have so softened the hard steel that it can be drilled out. This is one only of the many profitable uses that can be made of oxy-acetylene apparatus in metal-working shops, no matter what the line may be.

IS THIS THE LIMIT?

Motor car thieving appears to be reaching the status of an industry when we discover that the more enterprising of these gentry actually possess lorries fitted with hoisting gear, so that a car can be lifted bodily on to the lorry, covered with a waterproof sheet, and then taken out of the district without leaving a trace. Probably they have been conduced to by carelessness, but when a thief prowls around in a crane-equipped lorry and with an oxy-acetylene blowpipe apparatus, it really does not matter much what care is taken to prevent theft. The car that can be driven away probably will be, but if not, the simulation of a breakdown job is sufficiently reasonable to lull even the peripatetic policeman into an academic interest in the purloining.

A Plea For Model Making

Sir:—Having only been a subscriber to CANADIAN MACHINERY for a short time, I do not know if the subject of model making has ever been discussed in your pages before. If it has not, I for one, think that now would be a good time to make a start, and if you are willing to put this in print, will do so.

My idea is, that a boy apprentice or young man just starting a trade, will take more interest in his work if he is encouraged to make models of machines or engines either whole or in part. It is extremely educational, in that, the man (young or old) who desires to make a machine in miniature has got to know the principles of movement or action of the one he is copying. Because if he be ignorant of such he will have to study the larger one at work, and if at all possible take it apart to study it.

All this calls for a knowledge of machine design and drawing and is in itself of great educational value. The knowledge gained by thousands of model-engineers in Great Britain previous to 1914, was used to a great extent during the war, especially as hundreds who were experimenting with metallic alloys for aeroplane and other models where speed and lightness with great strength was required, gave their knowledge to the use of the country.

The factory where I served my apprenticeship in the '90's in England made complete rolling stock for a railway and all the boys were encouraged to make all their own tools and also models of machines and locomotives, coaches, cars, etc., according to whatever department they were in. A chum of mine who was in the passenger coach department made during his last years a complete passenger train and during the same two years I was busy making a 1/24 scale model of what at that time was the famous 307 passenger engine, winner of the first prize for speed and beauty at the Paris Exposition. I think that my model is still in the Machinery Department of the South Kensington Museum, London, England.

One reason that I am writing this is that I would like to see a society or association of model engineers started in Canada, similar to the one in Great Britain. During a 25 years' ramble 'round the world, working at the mechanical and steam engineering, I have only had the luck to meet 4 brother model makers, knowing them to be such when meeting them.

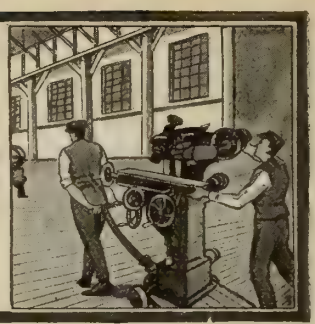
What really caused me to write this, was that I had just started to make a 1/12 scale model of a locomotive jib crane, two-drum electric drive with geared traverse and swing. Some friends who are not mechanics sneered at the simplicity of making such a toy, but to me it certainly is not a toy and I have found that working from memory as I am, it has some very puzzling peculiarities to overcome.

With a very small outlay for tools a man can make some very instructing models. One of the simplest to start on is a box or lattice girder bridge. Whoever starts one, if it is a long span, has got to remember or know quite a bit of side strains and vertical stresses to prevent buckling and so spoiling the finished article.

Trusting that you will print at least a part of the foregoing (picking what you desire).

I beg to remain, yours respectfully,
WM. R. GREEN,
Box 75, Eyebrow, Sask.

DEVELOPMENTS IN SHOP EQUIPMENT



THE STUEBING LIFT TRUCK

By J. H. R.

Local and interdepartment transportation in large manufacturing plants and warehouses, is a problem that has been given a great deal of attention during the past few years, and factory executives are realizing more and more the importance of this essential phase of plant management, not only as a means to greater efficiency, but also as an economic necessity. The method generally adopted for the transfer of material from one location to another is by trucking, in one or other of its many forms.

The truck here illustrated is that made by the Stuebing Truck Company, of Cincinnati, Ohio. It has many features that commend it to the user. It might be classified as a roller-bearing, all-steel lifting truck. The frame proper is made of high grade machinery steel of bridge construction, with spacing braces or saddles made of electric steel castings. This design insures the maximum strength and stability with extreme lightness. The four wheel type of support eliminates the possibility of dislodging the load when turning a sharp corner or when passing over irregular flooring. Both the head that supports the front end of the truck frame and likewise the large forked king bolt that carries the steering wheels are made of high quality electric steel castings, carefully designed to withstand the severest stresses. All four wheels are equipped with Hyatt roller bearings, and are of broad face to prevent tipping and injury to the flooring. Special facilities are provided to protect the roller bearings from dust and dirt. Milled oil reservoirs are provided in each wheel hub, and automatic closing caps are fitted to the oil cups.

The bearing faces on the front head and swivel are accurately machined, which permits of easy and smooth manipulation under heavy loads. The front end construction is designed so that the steering wheels may be turned through a complete circle if desired. The truck may be turned in a space equal to a little more than the square of its length.

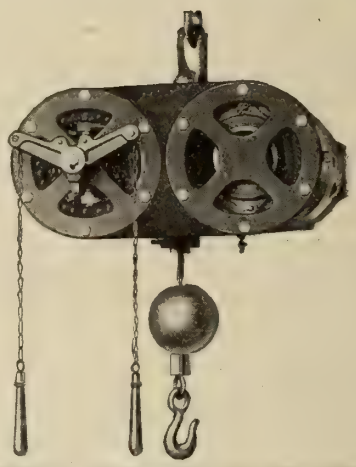
The lift hook, that is attached to the front saddle of the elevating frame, is operated from the lower end of the steering and lifting lever; both of these parts being made of special steel. The operation of the lift hook is semi-automatic in its action, and is controlled by the cast steel pedal that releases the hook from its raised and locked position.

The positive safety hydraulic check is of the double-acting engine cylinder construction, the chamber being accurately machined to fit the piston, which is provided with a closely-fitted ring that permits of automatic adjustment to different degrees of pressure and temperature. The flow of the oil can be regulated to suit the varying loads and conditions under which the machine is to operate.

These Stuebing trucks are made in several sizes, and special ones may be obtained to specifications. All essential parts are standardized and interchangeable. These trucks are being manufactured and sold on the Canadian market by the Canadian Ekron Scale Company, 16 Notre Dame Street East, Montreal.

NEW HOIST ANNOUNCED

After a long period of experimental development, Victor R. Browning & Company, of Cleveland, Ohio, announces the perfection of a new hoist, designed specifically for the severest kind of industrial service. This hoist is specially interesting in that it combines very admirably handling of features considered primarily essential, together with new ideas that are obviously of considerable value. The general shape and low design of this hoist adapts it particularly for use where headroom is limited or the



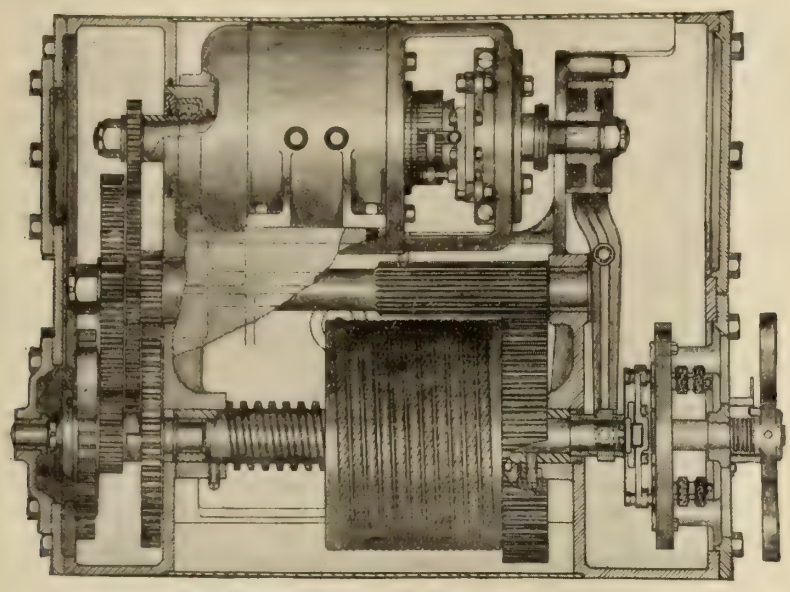
GENERAL APPEARANCE OF THE HOIST.

GENERAL VIEW OF THE TRUCK.

available space otherwise restricted.

The main casing which carries all moving parts, contains individual compartments for the four units, any one of which can be quickly removed if desired.

In one end of the casting heat treates gears and the disc load brake are assembled and revolve in oil. At the reverse end the controller and motor brake are carried in another individual compartment. The entire controller may be quickly removed for inspection or repairs, and the removal of a plate gives access to the gears and load brake.



SECTIONAL PLAN VIEW OF HOIST.

Between the gear and controller units are two long compartments, one of which contains the motor and the other the hoisting drum. The drum is carried on a threaded shaft and travels longitudinally while rotating. This feeds the cable through a bushing in the main housing and directly into the drum groove in rewinding. It is claimed that this adds considerably to the life of cables and maintains perfect balance. Simple but dependable limit attachments are installed at ends of the drum to prevent overtravel of the drum in either direction.

All bearings are large and bushed with phosphor bronze with exception of the motor, the shaft of which revolves on ball bearings. Two of the bearings are provided with grease cups while the other four are lubricated by splash from the gears.

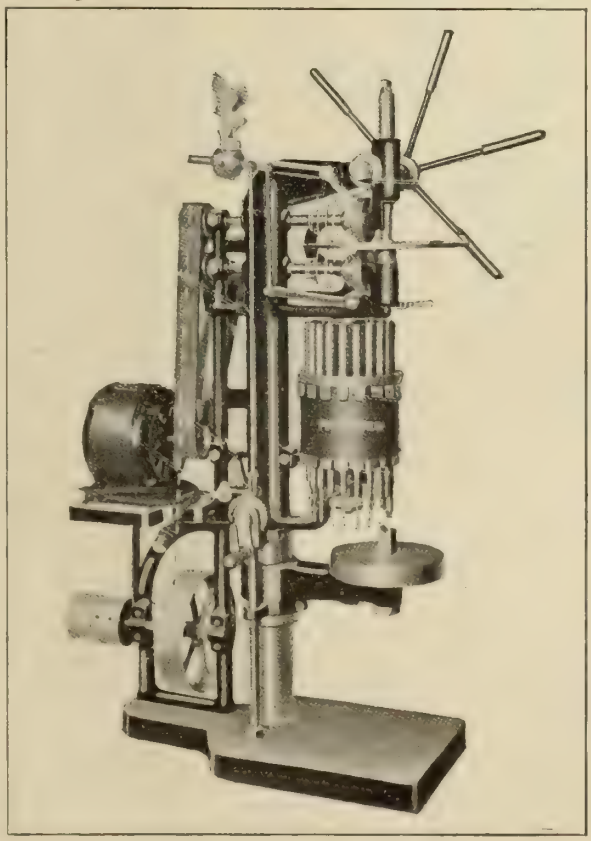
This hoist is furnished with specially designed motor either D.C. or A.C., and provision can be made for suspending it from an overhead trolley, I-beam, or any kind of fixture.

A circular describing this hoist in detail is available to anyone interested.

LIMA MULTIPLE-SPINDLE MAGAZINE DRILLING MACHINE

The multiple-spindle drilling machine, shown in the illustration and manufactured by the Lima Drill Press Co., Lima, Ohio, is known as the magazine type, and has features not common to multiple drilling machines. This machine will be found useful in the toolroom and to the shop man who has use for a number of various size drills, reamers and countersinks, eliminating the necessity of hunting and changing tools for each different operation.

The magazine having 16 spindles acts as a drill rack for 16 different sizes of tools. Each of these can be quickly brought into position for immediate action by simply turning the magazine to the point where the drill to be used is in alignment with the driving shaft. When a spindle is in the correct position for drilling, the magazine is locked by means of a bar, attached to the machine column which engages one of the slots in the bottom of the magazine.



GENERAL VIEW OF THE DRILL.

At the top of the magazine there is provided a convenient combination gauge and index showing at a glance the size of each drill. When a drill is changed, the gauge and index are also changed, which eliminates all delay and guesswork. The drill holders are arranged for straight-shank drills, small split collars being provided for the various sizes. The drills can be removed independently or a drill and spindle together can be lifted out from the top of the magazine. All the drill spindles except the one in position for work are locked in the "up position" and cannot be accidentally forced down. When an operation is completed and the feed wheel is released, the tool is returned to the up position by an internal coil spring which acts similarly on all the spindles. The magazine is automatically unlocked when the friction drive is disengaged, and can be easily turned to right or left when shifting another drill into position for work.

A noteworthy feature is the friction drive which is obtained by means of an aluminum disk 10 in. in diameter and ¼ in. thick. The disk is attached to the driving shaft and is driven by means of two leather covered friction wheels, each being 2½ in. in diameter and ½ in. wide. These driving wheels are directly opposite each other, the one above resting against the upper surface of the disk and the one below about ⅛ in. away from it. When the feed wheel is turned, the lower friction wheel is automatically forced against the under side of the disk, thus causing it to revolve.

The two opposed wheels serve a two-fold purpose by doubling the frictional contact and balancing the thrust.

Speed regulation is automatically obtained for each drill when rotating the magazine into place, as a rack-and-pinion device changes the position of the two friction driving wheels on the disk. When the driving wheels are near the centre of the disk, the disk and spindle will obviously travel at maximum speed, and the drills are so arranged in the magazine that the smallest drill is in alignment for use at that time. The machine is suitable for drilling wood as well as metal, and each spindle works in an adjustable bronze bushing arranged to take up lost motion due to wear. The illustration shows the machine arranged for both motor and countershaft drive.

Warned of the Shortage

SIX months ago this happened: Salesmen from steel mills went into a good many of the Canadian plants and told the parties concerned that now is a good time to buy. Prices are not going to be lower for a long time and the indications are that business is going to increase, with the result that your orders, if delayed, will have to stand in line and wait. Mills want business now, and they can give you the very best of service in regard to quick shipment.

Now imagine a salesman coming into your office today and saying: "We can ship at once anything you need in plates, sheets, tubes, hoop steel, bars, etc." He would be tossed out as unsound mentally.

Machine tool dealers not many months ago were telling you the same thing. They could get their orders through in a month. They could get you service then that all the money you can scrape up cannot buy now.

Now these are facts. Not only were the dealers trying to drive these matters home, but they were referred to many times in the market sections of this paper. For instance, the Pittsburgh correspondent of CANADIAN MACHINERY knows the steel situation in United States as few men know it. Readers of this paper have the benefit of his weekly review of the situation, and he gives his opinion freely of things as he sees them, and of events that are likely to work out of present conditions. A long time back he spoke of the time when steel would be scarce and premiums demanded.

It pays to read the market news. Buying is one of the greatest departments in the business. A good buyer is as essential as a good salesman, if not more so, for the reason that they are rarer. A good purchaser must know conditions. He cannot visit all the centres where raw material comes from, therefore, he must read them.

Conditions are not comfortable in a number of Canadian plants now, because customers persisted too long in staying out of the market. They were warned, but they did not heed the warning.

New York Papers Strike-tied

CANADIAN MACHINERY extends sympathy to the trade and technical papers of New York for the way in which they have been treated by certain of their mechanical departments. They had an agreement with their pressmen, but when it suited the pressmen to leave the premises, the agreement counted for nothing at all.

As a result such publications as *Iron Age, American Machinist, Machinery, Power, Electrical World,* etc., have had to more or less suspend. They have made an admirable attempt to keep their readers informed by various means regarding marketing and kindred conditions, but the outlay involved in keeping up staffs without any returns from advertising revenue must mean the loss of many thousands of dollars.

As far as the New York papers are concerned they did all they had agreed to do when they signed up. The strike to them was simply a case of gunning in a dark alley.

Canadian trade and technical papers sympathize with the New York publications, and hope that the right of their position will soon be so thoroughly demonstrated that publication under decent and secure conditions can once more be successfully undertaken.

Recommends Coal as Prime Mover

THE possibilities of developing power in Alberta are carefully analyzed by James White, of the Commission of Conservation in a paper now published, but read before the Industrial Congress at Calgary.

While, a little apart from the subject, it is interesting to note that the factories of the world, including electric lighting and street railways, use 75,000,000 horse power; the railways of the world, 21,000,000, and the shipping of the world, 24,000,000, or a total of 120,000,000 horse power. Of the 75,000,000 horse power used in factories and general industrial and municipal activities of the world, about 13,000,000 is used in the United Kingdom, about 29,000,000 in United States, and 6,000,000 in the British Dominions.

There has been more or less of a popular belief, or illusion, that the gas wells of Alberta were the greatest producers of power, and would continue to be. This conception may have come to pass from several reasons, and no doubt the rather extravagant claims of some of the publicity exploiters of the various centres have much to do with it.

Alberta has a great power proposition. This can be proved in several ways. She has, in the first place, 87 per cent. of the coal deposits of the Dominion, a splendid gas supply with a very high B.T.U. grading, while the waterpower of Alberta is by no means lacking.

The report of Mr. White makes it very plain that he considers that the greatest prime mover that Alberta can develop successfully is found in the steam-electric plant. Water power, owing to high labor costs, is laboring under a heavy, permanent handicap. Gas is an uncertain quantity regarding permanency, and depending on it might lead to serious losses. Regarding coal as a source of power, the report says, "Now, the great source to which Alberta must look for power is her coal. During recent years, the great advance made in the art of the production of steam power is phenomenal. This advancement has given coal, as a prime agency for power development in competition with other prime agencies, almost a premier position. Those interested in the furnishing of power on a wholesale scale in Alberta must make their research into, and selection from, the achievements made in recent years in the field of power produced from coal."

Throwing Away Millions

THIS paper has received from Ottawa a report entitled: "Report of the Administrative Chairman of the Honorary Advisory Council for Scientific Research of Canada."

It may be that the title is too ponderous—at least it is not inviting. Is there a chance for classing this very necessary work under a caption not so deep nor heavy nor forbidding?

The average man is not interested in research work. Those who realize the necessity for it have to fight considerable prejudice to get the necessary support to carry on their undertakings.

Research work as such, does not appeal to the popular fancy. It savors of academic routine, or the fancies of a hobbyist.

But let us approach a stage in our national career, when our natural supplies of raw material start to run short, or when it is very hard to secure them from other sources. Men have to admit, when asked what are we going to do about it, that they don't know what to do. They have no idea of what we have in our own land; they have never been mindful of the national stock takings that have been in order by the not overly-encouraged research workers. But they will be willing enough in their extremity to turn to the work they may have been inclined to merely tolerate when the going was good and the supplies of material were coming through without interruption.

The redeeming feature of the case, as far as the men behind the research work are concerned, is the ease with which they can justify their existence as a national necessity. Take, for instance, just this one statement regarding the matters receiving attention:—

> "The value of the fish waste in Canada, if utilized as it is elsewhere, would be very great. The quantity of solids in the three hundred thousand tons annually thrown away, and comprising chiefly fats and proteins is at least one-fourth of that amount and if subjected to appropriate treatment it ought, at the prices which prevail, and have prevailed, for the last four years, to be worth $10,000,000 or about one-fourth of the annual yield from the fisheries of Canada. The oil, contained in this waste should, if separated and purified, be worth on the market as much as $2,000,000."

So it will be seen that the work is not merely in the line of finding out our natural wealth, but in stopping waste and utilizing material that is at present going to the scrap heap. If we are going to move seriously toward national efficiency we must not only utilize our own materials but see that anything thrown away is good for nothing else.

The council for research work should be encouraged to go ahead. Their activities are such as to class them as national necessities.

The Art of Selling

ONE large Canadian establishment, selling machine tools, as well as other lines, had a meeting of its outside men—dealers—with the idea of making salesmen out of these dealers. The idea is good, the only drawback being on the face of it, viz., that it is impossible to make a salesman in two or three days.

The art of selling is not understood in many places. It is a great business. The real salesman never looks for a job. There are men around wondering when he is going to be through with the work he has in hand. They want to get in touch with him.

The real salesman is not the product of imagination, or of bluff or of glib tongue. He is not a shyster. He does not have to resort to sharp practice.

The trouble with us is that we have not made a business of schooling salesmen in this country. In far too many cases the man applies for a job. He says he is a salesman. He takes your line, puts his little bag under his arm and away he goes to blunder along and do the best he can. He has to make a living so he might as well make it out of you as out of any person else.

But did you ever look at it this way—your salesman is your representative. He is what the outside world, the buyer, sees of your firm.

Does the salesman get this broad view of the case—I am to all intents and purposes the firm? The man with whom I do business never meets the president or the general manager. All he has to draw his conclusions on is myself. If I am straight and clean and honorable in my dealings, if I refuse to resort to petty commissions, to little grafts, and if I do business on the dead level my customer is going to have a good opinion of my firm.

Don't let your men get out on the road half-baked. If you have any traditions that you want maintained tell him what they are. If you insist on certain standards being maintained see that he understands the motive. See to it that your salesmen are schooled, trained to go among men and study them, trained to meet with dignity and ease any position they may face.

Selling is an art—not a job.

If that is your end of the business, aim to be a real representative and salesman—there are plenty of travellers.

More Season-end Wrecks

THE end of the shipping season on the Great Lakes is proving again the possibilities of great loss of life in the attempt to extend the shipping season into the period when changes of winds come quickly, and when the seas are very heavy.

It may be an exaggeration to refer to many of the large lake vessels as fair weather craft, but that is not altogether wide of the mark.

They are long and unwieldy. Their power plant is not such as to give them speed to make for port quickly or right themselves at once in a heavy sea.

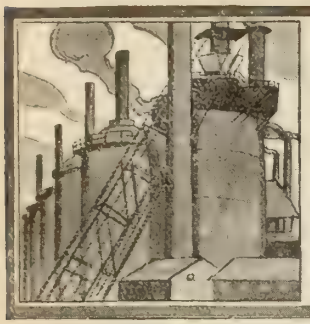
What is the cure? Of suggestions there are no end. Raise the insurance rates? No need to worry about that, as the underwriters will see that that is done as soon as the losses begin to make them lose too much money. Put a deadline on? That is hardly practicable. More signal stations or better service regarding warning vessels of approaching storms? The service that is given on the Great Lakes both by the United States and Canadian departments is good. Very accurate record is kept and displayed of all depressions and warnings are given of anything that may make the lakes dangerous.

The losses that seem to trail along and hang on at the end of the shipping season may be the result of several things. There may be the element of taking a chance. There may be that something that used to make the engineer believe he could make the next switch before the passenger train would get there, or that causes the driver of a flivver to reckon that he can get through between the truck and the street car.

After the great storm of 1913 on the Great Lakes, when the shores were strewn with the bodies of dead men and of wreckage of ships, there was a circular letter sent by the companies urging the captains to consider always the safety of the life and property entrusted to their care.

But warnings have a faculty of getting the edge taken off. That was six years ago, and the storm was an exceptional one. It is not likely to happen again. It's easy to reckon that way, is it not?

It does look as though the one thing that would cut down the tail-end casualty list for the shipping season on the Great Lakes would be the elimination of the "take a chance on one more trip" idea. The Great Lakes, when they get aroused at this season of the year, are no mill ponds. The chances for a lake vessel of low power getting through to safety are mighty small.



MARKET DEVELOPMENTS

Looks Like a Very High Market for Months Yet

Steel Shipments Showing Very Little Improvement—Premiums Are High and Prospects Seem to be That They Will be Higher in the Spring—Deliveries Slow in Tools

IT is hard to figure out anything but a high market for steel products for some time to come. Everything has pointed that way for some time back and things are working out true to form. Production is not at the same stage of efficiency as before the strike. The individual effort on the part of the employee is not the same. In many cases he has been given employment for the moral effect of the employment upon the strikers. He has been spoiled as a good producer.

Again, although the Steel Corporation may set its face against a higher price schedule, there is nothing to hold back the jobbers. The premium business is beginning to flourish now, and by the spring it seems certain that it will be flourishing still more. Some of the dealers also have a suspicion that certain mills will not be inclined to ship as rapidly as they might in the hope that prices will be on a firmer level later on, and they may be able to retard their outgoing material to get caught in this favorable tide.

As far as Canadian industry is concerned the situation is not favorable for the immediate future. There are many places where there have been no shipments coming in for the last six weeks. Dealers contend that they have not retired from the market in certain much-wanted lines, but the effect is much the same. They are so hopelessly overbooked that their delivery schedule runs away on into the second quarter of next year in many cases.

Machine tool dealers face much the same situation. With them it is largely a matter of getting the goods they can sell. There are special machines being brought out and out on the market in the States which are well suited for work that is being done in this country, but there is no chance at all of the Canadian dealers getting any of them because the capacity of the plant making them is in many cases sold out for a year in advance.

Coppers are weaker this week, and so is brass. Other lines in the scrap metal market are fairly firm but there is not much business moving. The Christmas season is always more or less dull with sales away off, and this year is no exception.

WILL THIS DELIVERY QUESTION EVER BE SETTLED FOR KEEPS?

Special to CANADIAN MACHINERY.

MONTREAL, Que., November 27.—Curtailment in production and increased difficulties of transportation, as a result of the delayed settlement of the coal troubles in the States, is now being felt in this locality, not seriously as yet, but nevertheless sufficient to cause some uneasiness as to the winter outlook. While the trade requirements here are not exceptionally heavy, the volume is of such a character that a steady supply is necessary to maintain normal operations in many lines of industry. Actual coal shortage is, so far, not in evidence, but strict conservation will have to be practised to avoid any acute scarcity during the coming months. Where the pressure is felt the most is in the inability to secure material from American producing points, partly due to the shutdown of plants and also to railroad inefficiency. Canadian authorities are doing what they can to relieve the situation, but close co-operation of manufacturers is urgently required to enable the fuel controllers to determine the proportion of coal delivered to this country. There is every reason to believe that Eastern Canada will be able to draw supplies from the Maritime Provinces unless trouble develops in these coal regions. At present there is a strike threatened at the Minto Coal Co., in Sunbury County, N.B. A strike is likely unless a satisfactory settlement is reached within a few days. The chief drawback at the present time is the great difficulty experienced in getting material through from the mills in the States.

In many mills the prices on steel commodities have been advanced, and the impression here appears to be that local quotations willl be raised to conform to the mill advances in the States. Warehouse supplies are being depleted, particularly in sheets and plates. Tubes also are very difficult to obtain. and further supplies are very uncertain.

Normally Sold Until Next June

General disturbances throughout the United States and Europe has resulted in a condition that makes the early future one of marked uncertainty. Outwardly there is little to indicate that the metal situation is other than normal, but apart from the trading in ingot metals, the market is suffering from the inability to obtain sufficient finished materials to take care of the present requirements. Speaking on the existing trade conditions, one dealer stated: "Business in the ingot metals continues steady, but on the finished lines, such as copper and lead sheets, galvanized and black sheets, we are virtually sold until next June. We had a letter from one producer in the States just recently to the effect that they were practically closed down, and for an indefinite period, owing to the shortage of coal and necessary raw materials. We have a number of requests in now for a first chance on any shipments of tin plates and sheets that may come through, but it is seldom that we are in a position to accommodate a customer owing to the material being previously disposed of. In most cases the goods never reach the warehouse, they being transferred direct at the wharf or the freight shed. Warehouse stock on finished sheets and tin plate will continue very low throughout the winter." Ingot quotations are quite firm, with the exception of tin and lead, the former declining one cent. to

57½ cents, and lead ¼ cent to 8¼ cents per pound.

Delivery Affects Business

The thought that is uppermost in the minds of the machine tool dealers is the disturbed character of general conditions, particularly regarding those in the United States, a factor that makes trading very uncertain. Present demand for machine tools and equipment is not heavy, but sufficiently large to sustain the interest of dealers, provided they could assure customers as to the definite date of delivery. Production in the States has been adversely affected by strikes and coal scarcity, a condition that has resulted in curtailment of operations, or as is the case in some places, of temporary suspension. Under the circumstances where new tools are hard to obtain, the inquiry for used equipment is more in evidence, but this field has been pretty well combed of the more desirable machinery. Considerable business is still being done in rebuilt machine tools.

Cast Iron Scrap Up

There is undoubtedly a better market in scrap trading than there has been for some time. The volume of increase is not large, it is true, but dealers are encouraged by the existing inquiry and the sales that are being made. The movement of non-ferrous scrap is steady and normal, but the iron and steel lines are the ones that are putting the new life into the present situation. Foundries in general are quite busy, and it is in the cast iron scraps that the demand is so pronounced. Dealers here state that cast iron scrap is almost impossible to get and the market is exceptionally strong. Quotations are advanced from $1 to $4 per ton. Malleable scrap is quoted at $18 on a $3 advance. Machine cast iron shows a similar rise and is quoted at $24. Machine shop turnings at $7.50 is an advance of 50 cents per ton. Stove plate is again up and dealers are paying $22. Cast borings are in good demand and are listed at $10 per ton.

CONDITIONS LIKE THE BIG WAR YEARS

Doing Business in Machine Tools is Largely a Matter of Making Deliveries

TORONTO.—To one who has done the machinery and steel market in Toronto during war and peace times, it might seem that, during the present, we are back once more to the war-time basis. A couple of years ago, it was largely a case of being able to make deliveries of machinery or steel. To-day, it is the same thing. True, the selling staffs of many concerns are getting drilled and polished for a hard campaign, for there is a realization in many quarters that more vigorous salesmanship is needed to keep things well booked ahead, but for all that, there is the same old problem of deliveries, and it is not improving. It is a safe guess that there will be a tremendous amount of material piled up against the capacity of plants for the coming year.

POINTS IN WEEK'S MARKETING NOTES

The matter of delivery is probably the outstanding feature of either the machinery or steel market at the present moment. Bookings in both lines are extended well into the first and second quarters of 1920.

One line of woodworking machinery sent out notices this week that they were announcing a ten per cent. increase on their special lines.

It is now almost six weeks since shipments of plate and sheet have come to some industrial and warehousing interests.

British machine tool makers, in spite of high costs, are making an attempt to get into the American market. The claim is that they are not suffering any more from high costs than are the U. S. makers.

Pittsburgh reports state that the steel mills, although taking on more men and getting better results, are making slow progress toward a normal production. Some experts figure that with present labor conditions it will not be possible to secure 100 per cent. operation.

Shortage of steel and coal is causing some anxious moments in circles where supplies of these have been allowed to run low in recent months.

The Machine Tool Market

Take the market for machine tools at the present time in Canada. It is a question of deliveries. Only this morning, one of the Toronto dealers showed CANADIAN MACHINERY a list of eleven firms to whom certain machines had been sold. Now he gets word that he has been allotted four out of the December shipment, six out of the February shipment, while no promise is made at all for the eleventh on the list. It is up to the dealer to sit down and try to figure out which four are the most urgent, which six are the least urgent, and which is the eleventh that he can stall for some time to come without cancellation. Now it may appear to be easy business on the face of it, but it is not.

Deliveries made to Canada from some of the American makers are not satisfying the dealers here by any means. They hold that, if their principals want to get into this market for keeps, they should make quicker deliveries here. Dealers who are exclusive agents, find it extremely hard to do anything at all for a prospect who wants anything like quick shipment. As one dealer put it to-day: "We are here to make a living, but just now we find quite a number of cases where we can do nothing for a man who wants his goods promptly. We do not want to handle used machinery, or to have to rebuild it, but what are we going to do?"

Other dealers hold that the present rate of exchange is tending to hold back business, and is quite a factor in favor of the Canadian-made machine. The opinion was also expressed that there should be an effort made so that the U.S. tool would not be, between duty and exchange, fifty per cent. higher to the Canadian buyer than to his competitor in the States.

A Serious Matter

Shipments of plate, sheets and tubes of wanted sizes are eagerly looked for just now in this district. In some cases, it is five weeks since there has been anything that looked like metal of these lines coming toward these premises.

Some interests seem to consider that the present is not the right time to buy, and have for that reason been staying out of the steel market. They may be right, but it is hard to see where they figure out the wisdom of such procedure. While some of the larger selling agencies here deny that they have withdrawn —or their mills—on account of too heavy bookings, the chances seem to point to their having to adopt this policy in some form or other. When those who have been staying out of the market start to come back, we fear that they will find a long line of business drawn up ahead of them at any of the mills. In the face of this condition, it is also hard to figure out where they see any cheaper steel for some time to come.

Scrap Is Not Busy

Copper and brass have fallen off during the week, but not enough to cause dealers to mark down prices which they are willing to pay. No. 1 lake ingot is selling, at this writing, for 19¼ in New York.

Some of the large users of brass are just now feeling the effects of the shortage that took place during the war. For instance, the gentleman who was doing the purchasing for the Linotype Co. of Brooklyn during the war, and prior to it, told CANADIAN MACHINERY a good one that illustrated how small peace-time orders looked when war work was at its height. Mr. Archer said: "We had been purchasers, annually, of a million pounds of brass for the making of matrix. During the war, I went down to the city where we placed our business. I thought that the order I was going to place would entitle me to a pretty fair reception, as the purchaser of a million pounds was doing some

business. The first man I fell in with was connected with the Italian Munitions Department, and he was headed for the same plant as I was. When he informed me that he was going down to see if they couldn't raise their deliveries to him from one to two million pounds PER WEEK, I saw where the chances of my million pounds per year were all faded. We are feeling the effects now of the shortage of brass that took place a couple of years ago, because our stock was heavily drawn upon, and we have not been able to catch up." Other lines where brass is used largely have had similar experiences.

THE PREMIUM MARKET WILL BE IN A FLOURISHING SHAPE BY THE SPRING

Special to CANADIAN MACHINERY.

PITTSBURGH, Nov. 27.—The union coal miners are still out, despite the recall of the strike order required by the Federal court. The officials of the miners' union are enjoined from paying strike benefits or encouraging the strike in any way, but there is room for suspicion that the striking miners are being kept in line by self-constituted committees at the individual mines. Meanwhile, negotiations on a wage scale are proceeding in Washington.

The steel industry has not actually suffered from shortage of coal to any extent, and is likely to get through the whole operation without much difficulty. The mills, as a rule, were well stocked with coal, and there are fairly heavy shipments, notwithstanding the strike, the non-union districts being in full operation, while the "open-shop" mines have been producing more or less. In the first full week of the coal strike, production in the United States was 29 per cent. of the average during the four weeks preceding the strike, when production had been particularly heavy, and 37 per cent. of the average during the first ten months of the year. The Connellsville region is non-union, and this helps greatly, as the region ships large quantities of coal, besides the coal it converts into coke in the region.

Steel Strike Crumbling

Last week was the ninth of the iron and steel strike, and during the week the strike was crumbling, instead of waning gradually, as in preceding weeks. The Wheeling district, the strongest strike region in the country, made a beginning of operations. While the beginning was a small one, it was very important. Last week also saw a resumption at the great plant of the Cambria Steel Company at Johnstown, 100 miles east of Pittsburgh, previously entirely closed. More than half of the men reported for work during the week. In the Mahoning Valley and at Cleveland, the resumption of work continued, and at a somewhat more rapid rate than in previous weeks. The Chicago-Gary district got still nearer to a stage of full operation.

The way the steel producers now look at the situation is that the strike is now so nearly over, and the virtual end so plainly in sight, that the strike itself disappears as an important factor, and the situation after the strike is the important matter. The after-effects of the strike will remain for a long time, probably from three to six months, with a labor shortage, as there was before the strike, with working forces more or less demoralized and requiring fresh lining up for efficient operation, and with the men more or less indisposed to do good work. Losing the strike does not make the men more anxious to render efficient service, and during the strike some of the men in employment have been more or less spoiled, because mill managements were so anxious to keep men on the payroll.

Production of steel in August, the last month for which a report of production has been made, was about 80 per cent. of actual capacity, according to a conservative estimate. In the first three weeks of September, just before the strike, production was probably a shade under 85 per cent. When the strike is entirely over, in the sense of there being no strikers left, production will hardly be more than about 75 per cent. of capacity, and it may be some time before an 85 per cent. rate is reached. Doubts are entertained whether it will ever be possible to reach 100 per cent. production with a general labor shortage in the country, such as exists to-day, and is likely to exist, as long as times remain good.

Steel Shortage

In the early weeks of the strike, it seemed strange that so little shortage of steel was in evidence. From the present viewpoint, it appears that this was due to consumers having stocks to fall back upon, for, with production materially greater than a month ago, steel is scarcer than at that time. Consumptive requirements may not increase materially in the next couple of months, but in early spring it is practically certain that requirements will greatly increase in nearly all lines. In addition, a large amount of building, involving the use of structural and other steel, is contemplated, and the only question is how much of it will have to wait. Already, fabricating interests are being asked to set aside jobs they are on and get to work on new jobs, offered at a premium. The railroads are, of course, certain to be in the market for some material when they have bought practically nothing for so long a time. The roads will be returned to their owners January 1, according to schedule, and in all probability the Government guarantee of earnings will be extended for a short time, while Congress determines the position the roads are to occupy eventually.

Keeping the Lid on Prices

The Steel Corporation's policy, decided upon many months ago, of holding the March 21 price schedule from any advances, is now fully worked out into practice, as the corporation subsidiaries have been selling large tonnages of steel for such deliveries as it can make, and all at not above the March 21 prices. For several weeks it has had no tonnage to sell, except for delivery after January 1. The last lines in which the corporation entered the market for 1920 were sheets and tin plates, the American Sheet & Tin Plate Company having opened its books November 15 for contracts with jobbers covering the first quarter of the year, and with large manufacturers for the first half of the year.

The Steel Corporation's policy will be followed by the large independents, generally speaking, but some of those that have been much affected by the strike, finding that it will be some time in March before they can complete their 1919 obligations, are indisposed to sell at this time for the later period. Possibly they hope that conditions later will be such as to permit them to sell at advanced prices, without incurring criticism of their regular customers for not following the Steel Corporation's policy.

The producers who thus sell far ahead, naturally sell only to regular customers of long standing, and when the prospective tonnage is not sufficient to go around, they must cut down inquiries. Their selling at March 21 prices will not necessarily hold the entire market to that level, for the unsatisfied demand will seek steel where it can be found, and that, undoubtedly, would mean premiums being charged by the smaller mills, such as keep their order books relatively clear, so as to profit by delivery premiums when obtainable. Prospects are that the premiums will increase in size and apply to more products, as the months pass. At present, there are premiums on sheets, merchant bars and wire products, also, in many cases, on tubular goods, particularly on large orders for line pipe. A fair guess seems to be that the premium market will be in very flourishing condition through the spring, and it may last longer.

BRITISH BUILDER OF MACHINE TOOLS ENTERING U.S. MARKET

Special to CANADIAN MACHINERY.

NEW YORK, Nov. 27.—An abundance of machine-tool business confronts Eastern sellers. The General Electric Co., Schenectady, N.Y., continues an active buyer, its inquiries in the past few weeks totalling nearly 200 tools. The Liberty Starters Co., Poughkeepsie, N.Y., a comparatively new concern, is out with a list of about 100 tools, which will be bought soon, and the Empire Cream Separator Co., Bloomfield, N.J., will buy 40 or 50 machines, to increase its output of milking machines. The Crane Co., Bridgeport, Conn., is inquiring for a few machines, and there are numerous other inquiries for small lots and single tools. November will be one of the best, if not the best, month of the year for many sellers in New York .

During the past week there has been considerable improvement, also, in the demand for cranes. The Follansbee Bros. Co., which is to build a new steel plant, with rolling mills, at Toronto, Ohio, has purchased about 25 cranes, at a total cost close to $500,000. The order was divided between the Morgan Engineering Co., Alliance, Ohio, and the Pawling & Harnischfeger Co., Milwaukee, Wis. The Drain Steel Co., Philadelphia, a new concern, has purchased four cranes, one of them a 100-ton ladle crane, for a new open-hearth steel plant at More, Pa. There have been a number of other small orders. Crane prices are stiffening, with improved business. For some time they have been close to cost, as competition has been keen and the capacity of existing crane manufacturing plants has exceeded the demand since the end of the war.

British Want Trade

One of the interesting developments in the American machine-tool trade, is the entrance of English builders into this market. Although handicapped by high-production costs in England, the English tool builders are making a determined effort to succeed in this market. One large company, Alfred Herbert, Ltd., wil make a determined effort, also, to capture a share of the Canadian market, where it should meet with even greater success, owing to the absence of a customs duty. Alfred Herbert, Ltd., has recently opened a display room on the street level at 54 Bay Street, New York, and is contemplating similar display rooms in Montreal and Toronto. At present, it maintains only an office in Toronto. No definite announcement as to its Canadian plans can be made by the company at this time, however, as arrangements have not been completed.

BIG EXHIBITION OF CANADIAN GOODS IN LONDON, JUNE 3 TO 17

Mr. Lloyd Harris, chairman of the Canadian Mission in London, says:

"I was able to arrange with Mr. Montgomery for the use of the Agricultural Hall, Islington, London, for the purpose of holding an exhibition of Canadian goods in June of next year. I am strongly of the opinion that if Canadian manufacturers will support this exhibition, and go there for the purpose of receiving business, that the results will more than justify the effort and expense involved, and I sincerely hope that the Canadian Manufacturers' Association will do everything possible to follow it through to a successful conclusion and thus follow up the pioneer work done by the Canada Mission."

Mr. H. Greville Montgomery has accompanied Mr. Lloyd Harris to Canada, for the purpose of promoting this great Canadian exhibition. He has had twenty-five years experience as a promoter of trade exhibitions.

Place

The Royal Agricultural Hall is London's second largest exhibition building and is near the heart of the city. It has a floor space of 60,000 sq. ft. splendidly adapted for exhibition purposes. Trade exhibitions are most important factors in the United Kingdom for bringing buyers and sellers together. They are promoted for the single purpose of developing trade.

To this exhibition buyers of goods throughout the United Kingdom will be invited by free ticket. It will be advertised in all the trade papers as well as in the London daily and provincial papers. A well-known artist will be engaged to prepare a suitable poster for street hoardings and railway stations throughout the country. The fact that this is the first time that any of the Dominions has had a great exhibition run exclusively in its own interest, will ensure wide publicity and great interest.

Canadian Organization

Mr. Montgomery has appointed Mr. O. C. Pease, 41 Victoria Street, Toronto, as his agent. He will allot space, arrange for transportation, receive monies, and conduct the general business of the exhibition on this side.

It is suggested that the following class of articles, all of which are in great demand in Europe, form the main exhibits: Minerals, chemicals, iron and steel products, railroad equipment, hand tools and shelf hardware, agricultural machinery, road-making machinery, transmission machinery, tin and enamelware, sheet metals, general building materials, textiles, clothing, footwear, pulp and paper, furniture, provisions, canned goods, animal products, confectionery, leather, paints and varnishes, brushes, wood products, rubber goods, carbides, asbestos products, and all other goods of Canadian manufacture which are seeking the world's markets.

Transportation, Storage, Cost of Space

Instructions will be sent to all exhibitors in respect to transportation. It is anticipated, however, that arrangements will be made to assemble all exhibits in Montreal not later than May 1 next, in order that they may be timed to arrive in London about the middle of that month. Each exhibit should bear the name of the exhibitor and other necessary information. They will be shipped direct to the Royal Agricultural Hall and will be placed in their respective positions by the exhibition staff. Mr. Montgomery is charging a flat rate of $1 per square foot of space.

Applications

Inquiries and applications for space should be sent direct to Mr. O. C. Pease, 41 Victoria Street, Toronto. Plans and full particulars will be sent on request.

The Canadian Manufacturers' Association in this regard, state:

"We consider this a splendid opportunity for manufacturers seeking an outlet for their goods in Great Britain and Europe. Those who participate in this exhibition will find that, instead of having to seek their customers, they will be brought to them. They will not only meet the distributors to the United Kingdom, but indent houses who are distributing abroad. Canadian troops have introduced Canada to the world. The Canadian Mission has followed this by obtaining an outlet for Canadian products valued at upwards of $100,000,000. It now rests with Canadian manufacturers to follow up this splendid pioneer work and show the world that we are producing a great variety of articles for which there is a tremendous demand. The association will do everything possible to facilitate this unique opportunity."

Merger Announced.—The Bridgeford Machine Tool Works of Rochester, New York, and the Betts Machine Company, formerly of Wilmington, Delaware, take pleasure in announcing a merger; the consolidation of the two companies, to be known as Betts Machine Company. The Bridgeford Machine Tool Works has specialized in building heavy engine lathes and axle lathes. The Betts Machine Company has been building heavy-duty machine tools for nearly sixty years. Bridgeford lathes and Betts heavy machine tools will hereafter be built by the Betts Machine Company, at their new plant in Rochester, and distributed by the Betts Machine Company, from Rochester and through their offices and representatives in New York, Chicago, Cleveland, and other large cities.

The Week's Events in Montreal Industry

The port of St. John, N.B., is partially tied up owing to the strike of the freight handlers. Temporary inconvenience is expected in the loading and unloading of ocean steamers.

The Hyde Engineering Company, of 175 McCord Street, Montreal, who have been extensively engaged in marine repair work during the past season, are looking about for a manufacturing line for the winter months.

J. A. DeCew, chemical engineer, and president of the Blashill Wire Machinery Company of Montreal, was in the city for a few days last week, and has returned to New York to negotiate new activities in connection with early developments in the company's business.

The Wheeler Life Belt and Fireproofing Company will remove from the present premises, 652 St. Paul Street West, to more commodious quarters as soon as these can be obtained. They purpose going in for the manufacture of mattresses in addition to their present lines.

Work on the Montreal improvements and extensions are progressing favorably. Considerable work has already been done on all of these, and it is expected that the two sheds on Victoria Pier, and the power plant for the electric roads, will be ready for operation next spring.

Frank Morrison, secretary of the American Federation of Labor, was in Montreal this week making arrangements for the annual convention of that body, the convention to be held in the Canadian metropolis next year. The number of delegates will depend on the accommodation facilities of the city.

Two men were killed and quite a number more or less seriously injured as a result of a head-on collision on the C. P. R. near St. Vincent de Paul, on the Island of Montreal last Saturday evening. It is thought that the steamship special overran the signals and collided with the local train.

Geo. E. Leighton, of 136 St. James Street, Montreal, the well-known consulting mining engineer, has recently been appointed vice-president of the Samuel Osborne Company of Canada, with head offices at 145 St. James Street, steel dealers and tool manufacturers. Mr. Leighton has just returned from a two months' business trip to England.

Damage to the extent of about $25,000 was done to the building of the Montreal Warehouse Co. on Wellington Street, Montreal, by a fire that visited the place last week. At the time of the fire the place contained a large quantity of leather hides, hundreds of barrels of pitch tar, automobiles, tractors and motor trucks, many of the latter being badly damaged by fire and water.

The Canada Steamship Company has acquired another 9,000-ton vessel which they intend placing on the route between New York and the West Indies. This vessel was purchased from American interests and the name will be changed from the "Shoshone" to the "Manoa." She has accommodation for 125 first-class passengers and 100 third-class passengers, and about 4,500 tons of freight.

Shortly after nine last Saturday evening fire attacked the main building of the Laval University of Montreal, starting in an upper storey. An explosion of chemicals added to the conflagration, and it was nearly seven the following morning before the fire was declared "out." The main building is completely gutted. The loss will be in the neighborhood of half a million dollars.

E. N. Davey, who has been in charge of the tool room of the United Shoe Machinery Company, of Montreal, has resigned from that position to enter business for himself, as a practical mechanician. He has acquired a small but well-equipped shop at 1227 Ontario Street East, and will go in for the manufacture of small precision tools and fixtures, automobile and general repair work; also oxy-acetylene welding and cutting.

The launch of the "Canadian Planter" last Saturday from the yard of the Canadian Vickers Company, is the seventh vessel to leave this shipyard this season. This most recent addition is one of those constructed for the Canadian Government merchant marine, and is similar in every respect to five others that have been delivered this year by Vickers. She is approximately 400 feet in length, 52 feet beam, and about 31 feet deep. In all probability this will be the last launch of the season, and, should the weather show signs of early winter it may be necessary to send the boat to Quebec for final fitting out. The yard will continue active throughout the winter as they have still six vessels on order, four for the Canadian Government and two for Norwegian interests.

BELIEVES THAT DEALER SHOULD HAVE AN ORGANIZATION HERE

"I think there should be some sort of an organization for the machine tool dealers in Canada, or at least in this district," said the president of one of the machine tool firms in Toronto to CANADIAN MACHINERY this week. "There are a number of matters," he continued, "that could be dealt with to advantage. But for the immediate present, I would suggest that the most important matter is the matter of discounts and general selling policy. To tell you what I mean, let us take a case, and it is not a fictitious case either, but one that does happen time and time again, and any machine-tool man will tell you that he has encountered such instances quite frequently. Smith is the customer, and he has four machine-tool salesmen coming in to call on him at various times. They all have machines that will do the work he wants, and they have good machines, and their prices are the same. Now, in that case, the only thing that should determine the sale would be the matter of delivery, or the ability of some one of the four salesmen to show that his machine has points for the job that will make it a more acceptable machine. But what happens? One of the four sits down and begins to figure out how he can land that order. Now, that is all right. Salesmen are out to sell, and they are expected to show results. So he figures that the machine sells for $1,000 at the factory in the States. He bases his price on $1,000, adds 35 per cent. duty. This should bring the price up to $1,350; but he reckons that he can afford to slip one over by basing the duty on $900, and bring the selling price to $1,315, showing his customer a saving of $35. Not much, you say. Perhaps not, but, in many cases, enough to turn a sale, for you must remember that we are only basing our calculation on $1,000, and the average sale is much in excess of that.

"Well, now, what happens? Smith buys three machines, and the salesman gets away with the business. Smith runs into another manufacturer who has purchased the same machine under less strenuous circumstances. He finds out that Smith has secured a better price than he has, and he immediately wakes up to the fact that he has been soaked, and that is the truth of the matter. He has been soaked, simply because he did not have them all there competing for his business. It is a poor way to carry on, but it is being done. The machine-tool salesmen could settle all that in a few minutes, were they to come together and think the question over seriously. There would be no hold-up, and no need of an increase in prices, but there would be the elimination of one of the worst features in the business, viz., the special concession that is figured out to secure an order, when there is competition for it."

Warner & Swasey Screw Machines

For large output and close limits—If you are figuring on screw machine work you can depend on W. & S. machines being right for the job.

We can supply you from stock immediately.

Trade Conditions in Old Country Works

In all Scotch steelworks the demand for ship and boiler plates is more urgent than it has been since Government orders ceased, and some makers cannot name a delivery date before January, even for specifications, which formerly would have been run off in a week's time. The extensions of works, meantime, are of no avail in permitting of makers meeting the demands made upon them. One department is standing out as an exception—viz., sectional material—which has fallen appreciably in the general demand. Makers are directing their attention more to meet shipbuilders' requirements. In malleable iron centres there is no cessation of activity, and makers of late have struck a good seam, from which substantial business may be looked for for some time. So many enterprises were hung up during the war that, now that they are being brought to light, makers are being rushed to provide the ways and means. Production could be widened if only labor would realize its national obligations and play the game.

No American Pig Iron

The talk of the prospect of American pig iron being soon dumped down in the Old Land appears to have evaporated, and, so long as freights remain high and facilities so uncertain, Scotch ironmasters have little to disturb their peace of mind with respect to the huge profits accruing to this particular industry. Another point is that the rise and fall in the value of the American dollar checks business.

A Great Wire-rod Mill

The past month has seen the formal starting of the big Morgan continuous wire-rod mill at Templeborough. The only other mill of this type is in South Wales, but it differs from the above in several important particulars, and is not so large. The mill converts a steel billet into a coil of wire rod in a single heat and without handling, all the work being automatic. The plant is capable of rolling nearly 1,500 tons of wire rod per week. The material in question is the raw material of the wire trade, and more than 100,000 tons per annum were imported from the Continent before the war. It is pleasing to learn that this country is now in a position to supply from internal sources all the rods that the wire trade requires. The prices at which the material is being offered also leave no inducement to users to place any of their business abroad. The adoption of improved methods of manufacture has enabled the rod rollers to reduce costs, and it only needs constant output to maintain this favorable condition. Wire makers almost without exception are extremely busy. So great is the demand from the home market that they have little to spare for export, and some amount of foreign trade is being turned away.

The Lot of the Manufacturers

Neither the recent grave disturbances in industry nor the state of the foreign exchanges has checked the inflow inquiries and orders for manufactured steel and steel tools. While the demand omits a number of Sheffield's staple materials, it is sufficient to provide a lot of work for the majority of the manufacturers. The talk about our markets being flooded with foreign merchandise turns out to be a bogey. The quantities which Germany is in a position to export are at present inconsiderable, and the United States, suffering as she is from an epidemic of strikes in all her trades, has little in the way of manufactures to spare for outside customers. Owing to the cause named, the output of steel in America has suffered a heavy drop of late, and it does not suffice for home needs. The British employer has much to contend with, but, bad as things are here, they are far worse in America, Sweden, Germany, and France. As regards British trade, Italy is proving to be a very unsatisfactory market. Her financial position is grave, and many of the works have had to close through inability to trade. Large stocks of steel obtained for war purposes remain in the country. Steel orders from the United States and Canada have been extremely limited for a long period, and not much of this trade which was lost during the war has been recovered up to the present time. Before the war both countries were big buyers of our most expensive tool steel. Formerly, Germany obtained her best razor and cutlery steel from Sheffield. Since the armistice was signed no orders from that country have been received in Sheffield, nor is business possible at the present rate of exchange. Cutlery steel would cost the Germans something like 5s. or 6s. per pound to-day.

THE CARE OF BELTS

(By J. H. WALKER, Mgr. Dominion Belting Co., Ltd.)

There are very few users of belts who give them the proper care. In the first place, they should be put on with clamps, or other means adopted, to take all the stretch possible out before lacing or attaching with other fasteners.

Every belt should have a proper dressing applied occasionally to keep it in condition. By this means drying out is prevented, and belts retain their gripping qualities on pulleys, which means a retention of the original power transmission.

A belt dressing containing resin or mineral oils should not be used, as these ingredients are most detrimental. Never use a belt dressing containing animal oils on rubber, balata, or stitched cotton duck belting.

The proper time to apply belt dressing is when the plant is closed down for a day or so; for instance, Saturday, as by Monday morning it has had a chance to penetrate the belt and keep it soft and pliable.

If kept in this condition there is no excuse for anyone resorting to the questionable remedy of applying resin, or any sticky dressing to get the proper power out of belts.

Belts used in saw mills and other plants that are shut down during the winter months should be taken off, rolled up, and kept in a warm place. If left on the pulleys and exposed to the changeable atmospheric conditions of a Canadian winter they will certainly have deteriorated by the spring.

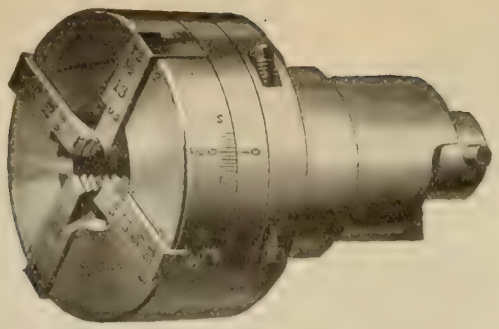
Carelessness in starting up machinery too quickly is liable to cause belts to slip on pulleys, thus injuring them. This can be obviated by putting on the power gradually, which gives belts a chance to get a grip on the pulleys.

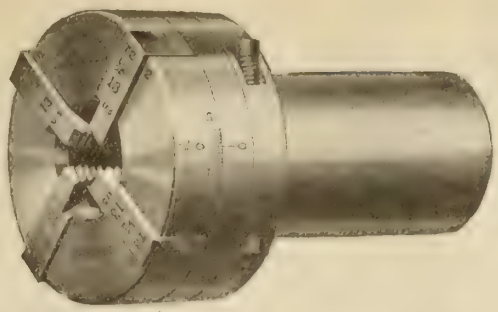
Another important matter is to have proper alignment of pulleys, as many belts give out before their time owing to defects in this respect.

Another mistake made by some belting users is practising false economy in getting belts too light for the work they have to do. While a certain weight of belt may at first do the work required, if it is necessary to keep it on a constant strain to accomplish this, both felt and machinery are going to wear out much faster if there is a "reserve." In other words, heavy enough belts should be used to ensure their not being overstrained. This may cost a little more at first, but pays in the long run.

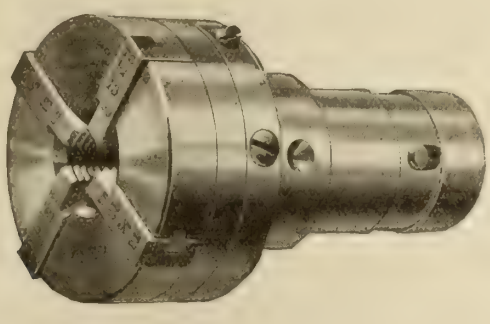
MUNITIONS PLANT OFFERED FOR SALE

The United States Government has been settling with Canadian companies which had entered into contracts for manufacture of war material. The process of making adjustments was rather lengthy in many cases, and there was a good deal of impatience in connection with the delay. The work has been proceeding slowly, however, and several adjustments of importance have been announced. A final settlement was made with the directors of Motor Trucks, Ltd., of Brantford. This plant was built in the final months of the war, and had barely commenced production when the armistice was signed. Expensive equipment was installed, and the plant was regarded as one of the finest of its kind in the province. The United States Government retains the possession of the building, and an effort will be made to dispose of it. An announcement was made in the "Brantford Expositor" that several offers had been made for the building, but that it is still unsold.





Geometric Solid Adjustable Die Heads



When one uses the word "ONLY," he needs to be sure of what he is talking about. With confidence we use the word in saying that a Geometric Solid Adjustable Die Head, fitted with a set of milled dies, is the only solid die head that will back off without stripping the thread.

Geometric Solid Adjustable Die Heads may be fitted with either a releasing shank, plain shank, or with special shank for the Gridley Automatics. The releasing shank permits the head to disengage from the shank upon completion of the thread. The plain shank fits the head for use on the turret of a lathe or on a live spindle, such as a drill press.

Apart from the fact that it is not equipped with the self-opening feature or the roughing and finishing attachment, the Geometric Solid Adjustable Die Head is the same in principle and construction and will do equally as accurate work as the other styles of Geometric Die Heads.

Whatever the requirements, there is a type of Geometric Die Head best adapted to the work.

SHEET SHORTAGE BEING FELT NOW

Kitchener Firm Has Not Had a Shipment for Some Weeks Past

Kitchener.—"Yes, we do feel the effects of it," Manager A. S. Capwell of the Canadian Blower and Forge Company, Ltd., said when asked whether there is any noticeable effect of the steel strike in the United States.

Mr. Capwell said that it is difficult to get shipments of sheets. Orders for sheets which were placed months ago have not been received by the plant. Stocks from which foundries and forging plants have been drawing are running low and in many cases are exhausted. Should the strike not be settled soon the situation will become very serious and many a shop will certainly be up against the inability to get its raw products.

The Canadian Blower and Forge plant is busy with orders and all the raw material available. The company continues to enjoy a good share of export trade. Forges, blowers and other divers lines are being turned out for New Zealand, Australia and South Africa. Orders for heaters also have been received from England. The only difficulty is the scarcity of boats.

The company has about 150 men on its pay roll, more than at any time, not including the period during which the plant was engaged on war orders.

PIG IRON TRADE

The market is steadier than has been the case lately, and the fervid demand for spot iron is easing up. Basic grades have advanced, and are strong. Following are reports from U.S. centres:—

Pittsburgh—The increased demand for steel-making iron has put basic on the same level as other grades, in regard to price. Basic, for December shipment, has been sold at $30 valley furnace, and first quarter Bessemer at $31.50 valley. Foundry iron, prompt delivery, is around $34 furnace.

Boston.—There have been good sales during the week, but mostly for first half delivery, but spot iron has receded somewhat from its high position. A quotation of $37, delivered for 2.25 to 2.75 silicon, was refused by the enquirer.

Birmingham.—There is good enquiry here, and an advance of $1 has been made. Makers are cautious about making sales, fearing a wage adjustment that will increase costs.

Buffalo.—There is a shortage of iron in this district, and Canadian furnace is finding a market here. No. 2 foundry is being bought at $34; No. 2X at $35.25; and No. 1X at $37.

Cleveland.—Furnaces are not very anxious to accept first-half business as yet. This is evidenced by the difficulty the large automobile manufacturers are having in finding makers to undertake their requirements, which are in the neighborhood of 100,000 tons of foundry and malleable. 1.75 to 2.25 silicon foundry-iron for first half has been placed at $32 furnace.

Cincinnati.—There is not much iron available here. A sale of malleable for this year's shipment has been made at $35 furnace. Spot iron is scarce, and no quotation for future iron can be obtained.

St. Louis.—The market is firm, with a tendency to become stronger. Furnace interests are going out of the market, and some good orders have been turned down. Spot iron is bringing fancy prices, and 1920 iron is not being touched.

New York.—There has been considerable 1920 business closed during the past week. About 15,000 tons has been booked by an Eastern Pennsylvania furnace for delivery in this district. High silicon iron is scarce and prices up.

Philadelphia.—The prices in the pig-iron market have receded somewhat during the week. Basic has been sold for 1920 delivery at $31 to $32, delivered. Export enquiries for 22,000 tons basic and 10,000 tons foundry are out.

U.S. SCRAP METAL

There is a strengthening of the scrap iron market all over the country, and enquiry is brisk. Following are reports from various centres in the U.S.:—

St. Louis.—The scarcity of pig iron is reflected in the strong demand for scrap, while rolling mills are also in the market. Stove plate has advanced $2 to $26.50; railroad malleable has advanced from $18 to $25 a ton. Railroad offerings are light.

Boston.—There is a good demand for all grades of scrap, though, owing to its scarcity, there is no great volume of trading. No. 1 machinery has been sold at $32.50, delivered at foundry.

New York.—There has been a general advance in prices of all grades of scrap. Heavy melting is quoted at $17 to $17.50, old steel shafting $24 to $25, machinery cast $25 to $26.

Philadelphia.—A comparatively small volume of business, coupled with a big demand, has caused an advance in all grades here. Advances vary from 50 cents to $2 per ton. There is an inclination on the part of dealers to hold stocks for higher prices.

Pittsburgh.—The market here is advancing, more in sympathy with the eastern pig iron market, than from any particularly strong demand here. Heavy melting is looked to for a sharp advance very shortly, while cast-iron borings are selling round $20. No. 1 cupola cast is $29 to $30.

Buffalo.—There is a very big enquiry for steel-making grades, as well as foundry, and all grades have advanced. The enquiry for heavy melting totals 100,000 tons.

Cleveland.—Foundries are in the market for cast scrap, the supply of which is getting scarce. Increases have taken place in many grades, and dealers are confident of higher prices in all grades. Dealers will not sell steel scrap on contract under $25.

Chicago.—There is a good demand for malleable grades, while heavy melting is comparatively quiet. Some big deals have been closed, including 50,000 tons of shells, in one lot, with two smaller lots of 25,000 tons and 10,000 tons. Malleable sold at $28 per gross ton.

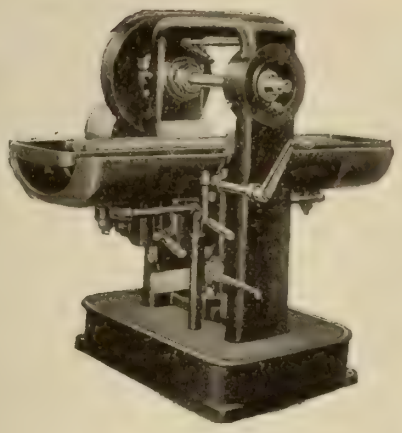
Cincinnati. — There has been no change in prices, but the tone of the market is firm. The car situation is better.

Birmingham.—The demand for cast and stove plate is very strong, with lower grades active. The market is stronger. More material will be available after the end of the year.

While there is reason for believing that no very extensive contracts have been given out yet for work in the devastated regions in France, there are occasional rumors of important undertakings being placed in the hands of foreign firms, and from a German source has come the news that reconstruction work on a very large scale, including the rebuilding of Laon, has been confided to British firms. This news has been officially denied. Not long ago it was stated that Laon was to be rebuilt by the Americans, but, while negotiations are certainly in progress, it is not likely that any very large contracts will be given out until arrangements have been completed with the Germans for the execution of the preliminary work. The chances of British and American participation are much brighter since the Government has come to the conclusion that this must be done if the Allies are to help France in its present sore need.

Speaking on Progress of Aviation in the War Period, before the Royal Aeronautical Society recently, Dr. Leonard Bairstow said that the speed of aeroplanes has increased from 85 to 135 miles per hour in five years, and some further improvements might be expected in the future. No equal addition to the speed range was probable, and economy suggested a reduction. It was not possible to decide from a single estimate of the value of speed in civil aviation, but for fighting it was the last reserve of superiority which was all important.

BRIGGS MILLERS



We Call It the Big Little Milling Machine

And so it is. A man who is unfamiliar with the "Briggs" and the work of which it is capable is always surprised at the power available and the extreme rigidity on any milling operation which is within the range of this tool. It is a small machine; but the solid over-arm construction and the convenience of operation make it a manufacturing machine of unsurpassed production possibilities on all work which it can handle.

The low first cost of the Briggs Miller is another of its surprising features. The floor space required is small. Upkeep is slight. operating cost is low because skilled labor is not required to obtain the best output of which the machine is capable. And there are other advantages, too, which we'll be glad to explain in more detail.

INDUSTRIAL NEWS

NEW SHOPS, TENDERS AND CONTRACTS PERSONAL AND TRADE NOTES

PERSONAL

Thos. Firth & Sons, Limited, Sheffield, Eng., announce that Mr. James A. Sherwood, who has for a number of years represented them in Canada, is retiring, and that Mr. John J. Coleman, who has had charge of the Toronto branch, has been appointed as successor to Mr. Sherwood. Mr. Coleman has just returned from Sheffield, England, where he spent the month of September.

TRADE GOSSIP

Want to Buy Furnace.—The Hammond Steel Co., Inc., Syracuse, N.Y., are in the market for a second-hand six-ton Heroult electric furnace, complete with transformers and all equipment necessary to start operations.

Belleville Gets New Mill.—The Judge Jones Milling Company, of Montreal, have transferred their plant from that city to Belleville. The firm, who are manufacturers of cornmeal, oatmeal, rolled oats, and other cereals, are building an elevator with a capacity of 45,000 bushels of grain.

Establish Branch in Woodstock.—Another United States manufacturer, this time the Hook and Eye Company, have established a Canadian branch in Woodstock. Premises have been secured and the production will soon commence of hooks and eyes, safety pins, dome fasteners, etc. This is the second new industry to come in ten days.

Canada's Trade Declines.—The seven months of the fiscal year ending October 31, show a decrease in the country's trade of $33,000,000, as compared with the same period of last year. The total trade for the seven months' period of this year amounted to $1,259,648,374, while for the seven months of 1919 the total was $1,249,493,885.

Moving Office.—The Union Carbide Co. of Canada announce that on November 29 they will conduct their sales office from Welland, where the works are located. The Toronto offices have been located heretofore in the Dominion Bank Building. The firm's reason for taking this step is that they believe they can secure better results by having the sales office and factory together.

New Factory for Willards.—What is claimed to be the largest ice cream factory in the world, will be erected at Dupont Street and Manning Avenue, Toronto, by Willard's Chocolates, Ltd. They will ship ice cream by carloads, daily, to Montreal, Hamilton, etc., in the summer. The ice consumed will amount to 200 tons daily, and a carload of salt per day will be used.

Appoint Separate Boards.—In connection with the disputes in the Sydney coal mining fields, the Department of Labor has agreed to appoint separate conciliation boards for each colliery. The miners wish to have one board to cover all. However, they will appoint the same representative to all the boards, their choice being J. C. Watters of the Trades and Labor Congress.

Gillies Bros.' New Mill.—The new mill which Gillies Bros., of Braeside, are building to replace their lumber mill recently destroyed, is of concrete construction. This is a new departure in sawmill construction in Ontario. The new mill will be 190 feet by 73 feet, facing the Ottawa River. All the machinery wil be electrically driven. A. F. Byers & Co., Montreal, are the builders.

Pumps Have Short Life.—The Board of Control of Toronto were informed by Works Commissioner Harris that the four electrically-driven pumps installed in John Street pumping station in 1911, are in need of renewal. One is at present out of commission, and three others are in such condition that further repairs are not worth making. Provision has been made in the estimates for $75,000 for new pumps.

Making Tractors. — Manufacture of tractors is being commenced in the Cluff Bros. ammunition plant on Atlantic Ave., Toronto. The interests of the Chase Motor Truck Company of Syracuse, N.Y., were purchased recently by the Cluff organization, and the plant headquarters have been moved to Toronto. It is proposed to make a large number of tractors for the season of 1920. The company does not intend to make cheap tractors, but has announced its intention to concentrate on a high-grade machine. After study of the tractor situation they determined that there is need for better tractors rather than for cheaper tractors.

Going to Galt.—It was announced by the Board of Trade that another new industry has been secured for Galt—McCaskey Systems, Ltd., of Carlaw Ave., Toronto, a branch of an American concern of Alliance, Ohio. A special committee of the board has been negotiating with the firm for some time, and a deal has just been closed whereby the concern purchases the modern manufacturing plant of the Roelofson Machine Tool Company on Beverley Street. This industry, which manufactures counter checkbooks, credit registers, and professional systems, will locate there next summer, and will employ about 100 hands, 50 of whom will come from Toronto. The firm has outgrown its Toronto quarters.

Sydney Mines. N.S.—Asked to confirm the report that industrial conditions showed indication of improvement at the Steel Plant a Scotia official spoke optimistically and felt confident that within a short time there would be a change for the better, although he was not in a position to say when business would get back to normal. A considerable quantity of pig iron arrived from the car works, New Glasgow, during the past few weeks, sufficient to keep two open hearth furnaces in operation for a period. There is only a working force of three hundred men employed in the plant. With the blast furnace again going full steam ahead, this force will necessarily be increased, and everybody employed. The steel workers are hopeful that trade conditions will soon be restored to normal.

MARINE

Port Colborne.—During the recent storm about 100 feet of the superstructure of the eastern pier at Port Dalhousie sank. This has left considerable debris, and vessels entering the port are warned to keep as far as possible to the west of the east pier.

Nobel Plant is Sold.—The British Cordite Munitions plant at Nobel, near Parry Sound, has been sold to Mr. I. Cohen, a well-known merchant of Kingston. Nothing is known of what Mr. Cohen's intentions are with regard to the property, which includes buildings, machinery, trackage, etc.

Van Horne Property Sold.—The Realty Service Company have sold the property on the north side of Van Horne Street, west of Dovercourt Road, to Soren Bros., tinware manufacturers, who will erect a new factory there. The property contained 332 feet, and the

price obtained was in the neighborhood of $50,000.

St. John, N.B.—Sir Frederick Lewis, chairman of the Furness, Withy Company, has been looking over the harbor of St. John, and is of the opinion that better facilities are needed. One of the most important requirements was the extension of the breakwater from West St. John to Partridge Island, in order to protect existing and contemplated facilities.

Sault Ste. Marie. — The wooden steamer Myron foundered a mile and a half off White Fish Point, Lake Superior, and her crew of eighteen men with the exception of the captain, who was picked up after floating on top of the pilot house for 20 hours, are feared lost. Several attempts were made by passing steamers to rescue the men, who were in boats and on rafts, but, although lines were thrown to them, they were unable to hang on. The weather conditions were such that the would-be rescuers had to leave the men to their fate.

New York.—The steamer Imperator has been handed over to the British Minister of Shipping by the U.S. Shipping Board. The Imperator will sail for England shortly, and will be used in the Cunard Line service.

Bridgeburg Gets New Plant.—The Reliance Manufacturing Company, with a capital of $500,000, will locate in Bridgeburg. The factory will be on Lewis Street, and the product will be electrical goods, such as fuses, switches, etc. The Brazil Motors Company, of Brazil, Ind., which is considering Welland, Port Colborne or Bridgeburg as sites for a factory, has arrived at no decision yet.

Railway Board Decides Dunnage.—The amount of dunnage that will be allowed on agricultural machinery, implements, stoves, street cars, vehicles, etc., shipped in box or stock cars, has been fixed at 650 pounds by a judgment of the Board of Railway Commissioners. The allowance was formerly 1,000 pounds, and this has now been cancelled.

No Coal From Ontario.—The Fuel Commissioner has issued an order prohibiting the shipping of any bituminous coal from Ontario without a permit from him. This order is to insure the supply of bituminous coal for Ontario needs as the commissioner feared that attempts might be made to ship some of the coal stored here to points outside the province.

Collingwood. — The steamer M. J. Nessen, of Chicago, was seized by the Chief of Police, acting under instruction from Messrs. Burke, of Midland. The vessel is under repair in the yard of the Collingwood Shipbuilding Company, and the seizure is on account of expenses incurred in raising the vessel when sunk at Meaford. The captain of the vessel claims that the charges are excessive, and will give bonds to cover the amount. He will fight the matter in the courts.

Sault Ste Marie.—Tugs searching the lake for traces of the John Owen returned with wreckage bearing the name of "John Owen." This destroys all hope of the steamer not having been lost. Hatches and other movable fittings have been found, but no traces of a lifeboat or life preserver. There is little chance of any of the crew having survived.

TENDERS

The Department of Public Works, Ottawa, are asking for tenders for the reconstruction of the wharf at Owen Sound. Tenders will be received up till noon Friday, December 12. Plans and forms of contract can be seen at the office of the District Engineer, Equity Building, Toronto, and at the Post Office, Owen Sound.

CATALOGUES

Black & Decker, Baltimore, have issued a new catalogue on portable electric tools, electric air compressors and special machinery. The catalogue is an excellent specimen of good typography and presswork. Besides the above-mentioned lines are drills, tapers, sleeves, etc. Black and Decker products are covered by the usual guarantee. The firm warns against having repairs made by unauthorized parties. The catalogue is being issued twice a year by this firm.

BOOK REVIEWS

The University of Illinois Engineering Experiment Station has issued bulletin No. 110 on "Passenger Train Resistance." The department of railway engineering of this university has, for some years, carried on experiments to determine the tractive resistance of steam railway trains and electric railway motor cars. The result relating to steam railways thus far furnished have applied only to freight trains; this bulletin presents for the first time result of experiments with passenger trains. These experiments were begun in 1908 on local trains and were resumed during the spring and summer of 1915 on through passenger service. The results presented in the bulletin define the resistance of trains that move throughout the ordinary range of speed of passenger trains. It is also made clear that in passenger, as in freight trains, the resistance expressed in pounds per ton varies with the average weight of the cars composing the train and works the same for trains made up of heavy cars as of trains made up of light cars.

The University of Illinois Engineering Experiment Station has issued bulletin No. 109 on "The Orifice as a means of measuring the flow of water through a pipe." In this bulletin are given the results of tests made to determine the practicability of measuring the flow of water by means of the thin-plate circular orifice inserted in the pipe, to determine the experimental co-efficients for calculating the velocity of the flow in the pipe and the discharge and to determine the conditions most favorable to the use of such an orifice as a flow measuring device. The theory of the orifice is first developed and tests and results are given in exhaustive form. Further subject matter has to do with the effect of deviation from standard position and the general applicability of the pipe orifice method is thoroughly discussed in the summary. It would seem that this device might well be used, for example, in testing the efficiency of certain forms of pumps in measuring the performance of individual wells of water works systems, in determining the water power for individual purposes in mills and factories, in measuring the discharge through city main and in distributing water for irrigation purposes.

"The Manufacture of Chemicals by Electrolysis," by Arthur J. Hale, B.Sc., F.I.C. Price 6 shillings. Eighty pages. Constable & Co., London.

The manufacture of chemicals by electrolysis is of sufficient importance to justify the appearance of a monograph on the subject. Accordingly the author has given a complete and up-to-date account of processes now in use, and an indication has been given of future developments.

KEEPING SMOKESTACKS IN CONDITION

Owners of factories are usually interested in preventing the depreciation of their plant buildings and equipment by frequent painting, but they oftentimes are prone to forget to take corresponding precautions to insure the long life of their smokestacks. When rust put a smokestack out of business it means putting up a new one and possibly the tie-up of the entire plant. Therefore, this important link in the equipment should be kept in good condition by paint ing about once every two years.

There is on the market a special smokestack paint, which, drying to an enamel-like surface, prevents the metal from the stack from corroding as a result of exposure to moisture in the air and to gases in the smoke. It is also proof against the high temperatures to which stacks are subjected, and may, if necessary, be applied when the stacks are hot. It is to the advantage of every mill owner to use this paint frequently to double the life of the smokestacks in his plant.—Compressed Air.

Pig iron continues to advance. The valley market now stands as follows: Bessemer, $31.50; basic, $30; malleable, $32 to $33; foundry, $33 to $34, f.o.b. valley furnaces.

1410 Royal Bank Bldg., Toronto, Ont.

THE "WANT" AD.

The "want ad." has grown from a little used force in business life into one of the great necessities of the present day.

Business men nowadays turn to the "want ad." as a matter of course for a hundred small services.

The "want ad." gets work for workers and workers for work.

It gets clerks for employers and finds employers for clerks. It brings together buyer and seller, and enables them to do business though they may be thousands of miles apart.

The "want ad." is the great force in the small affairs and incidents of daily life.

One of the things we all do well is to forget.

Names that were household words yesterday are gone to-day.

Because people knew your Name and your Line a year ago it is no sign they do to-day. They forget easily.

Keep yourself in the public mind by advertising. It is just as important to make old friends remember as it is to win new friends. Advertising does both.

NEW MITRE BOX PATENT

If you are interested in buying a patent for the latest labor-saving device in mitre boxes, address Box 636, Canadian Machinery. (c22m)

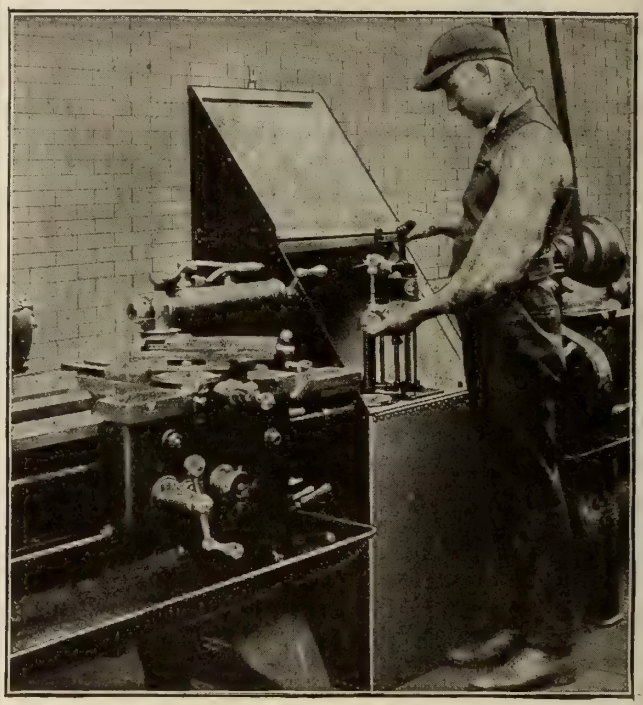
Prevent Idle Time of Men and Machines



By placing Bowser Lubricating Oil Cabinets in departments where oil is used.

There is no going back and forth to the oil room, no spilling, no wasted oil, no fire risk from the oil storage.

Save the Oil

The oil supply can be stored and handled as systematically as raw materials or finished parts—income checked, distribution measured, charged and recorded.

Write for literature, explaining why and how Bowser Systems pay for themselves, many times over in saving of oils and labor.

RALPH CONNOR

On "The New Canada and Its Needs"

RALPH CONNOR, the famous Canadian novelist, who served for several years at the front and saw the war from many angles, is convinced that Canada must be prepared to make important changes if she is to profit by the lessons of the war. He has written a series of articles embodying his views and calling vigorously on patriotic Canadians to awake to the needs of the hour. The articles, which deal with economic, social and Imperial topics, were written for MACLEAN'S MAGAZINE and the first appears in the November issue, under the title: "The New Canada and Its Needs."

Every Mother Who Lost a Son at the Front

will read with deepest feeling Nellie McClung's wonderful story, "Men and Money," which also appears in November MACLEAN'S. Mrs. McClung wrote this story with a purpose—to show the ease with which the world forgets the contribution these mothers made. But it is also a very fine story—real, human and gripping.

"The Idle Hands at Ottawa"

By J. K. MUNRO

The recent session of the Dominion House was in many respects an idle one. There was not a great deal done, so the members had a lot of time to stir up things, and the result was some hugely interesting political situations. All of which J. K. Munro tells about in his usual unsparing and tersely humorous way.

Remarkable Features of a Remarkable Number

The November MACLEAN'S is cram full of other big features—famous writers on vital subjects and everything **Canadian.** Look over this list:

Baroness Orczy.—The author of "The Scarlet Pimpernel," best seller of best sellers, is represented by a serial story. "His Majesty's Well Beloved."

Robert W. Service.—The great poet of the Yukon and the battlefront contributes a strong poem, "The Outlaw."

Basil King.—This great novelist who lives abroad contributes an interesting discussion on "Why I Remain a Canadian."

Janey Canuck.—An article on Mrs. Murphy's experiences as the first woman magistrate in the whole of Canada.

Camilla Kenyon.—A new novelist who promises to become a great favorite, tells a humorous story of adventure, and treasure, "Spanish Doubloons."

Stephen Leacock.—A humorous sketch entitled, "My Memories and Miseries as a School Master."

"Two Men and an Idea That Grew and Grew and Grew."—By Charles Christopher Jenkins.—A sketch of two remarkable and practically unknown Western Millionaires.

"A Little Bit of Chicken Feed."—By Allen C. Shore. A bright story combining love and business themes.

"The Rainbow Death."—By Madge Macbeth. An intensely interesting detective story.

"The Search for Missing Men."—By Gertrude Arnold. An article on hospital experiences at the front by a young Canadian V.A.D.

MACLEAN'S will be Twice-A-Month

starting February 1st, next year. An important point to remember. If you want to keep up with things **nationally Canadian**, you'll have to get the MACLEAN'S Twice-A-Month habit.

Over 70,000 Canadian Families Buy

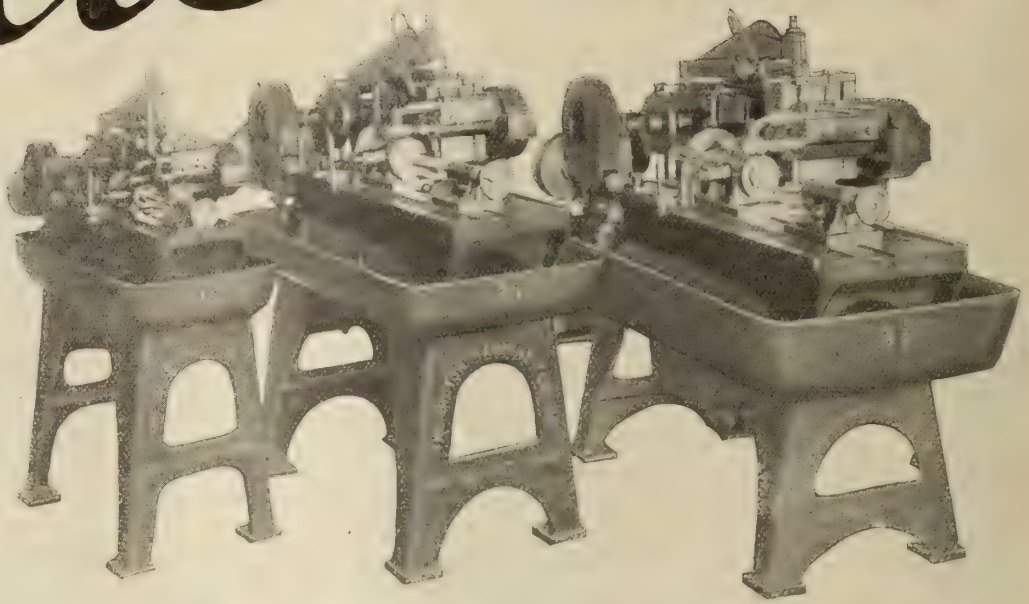
Bilton GEAR MILLERS

Fully Automatic

Their adaptability is almost unlimited on small work—such as cutting spur, bevel, miter, angle gears, saws, ratchets, sprockets, cutters, knurls, taps, cylinders, form cutting, manufacturing, milling, etc.

A big time saver—as indexing takes place during return stroke of cutter — which is removing metal 90% of the time.

Write us for Catalog 30-6



Over 500 leading manufacturers now use the Bilton for high production on accurate work.

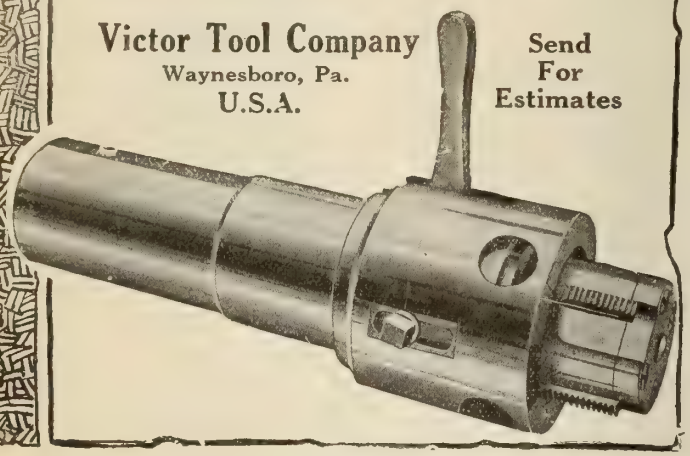
We wanted something original— this is what we got

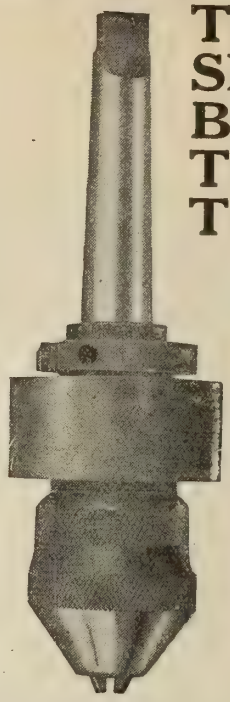
"BOTH in these operations and half another — I'll show you later — completed in the time our old taps took to do one; that, I guess, is why we continue to use your Victor Collapsible Taps."

It was the often-heard story of time saved, of costs lowered, of all threads clean and smooth. And it was pleasant to hear.

Victor Tool Company
Waynesboro, Pa.
U.S.A.

Send For Estimates





The Saving Slip of the Bicknell-Thomas Tap Chuck

is its most important feature. Powerful enough to drive the tap under all ordinary conditions, the friction slips before enough strain can develop to break it. Compact — invaluable on multiple spindle machines. Adaptable — ideal for tapping blind holes.

Made in four sizes — from ⅛ to 1 inch taps. Straight or Morse taper shanks.

Let us send this Circular

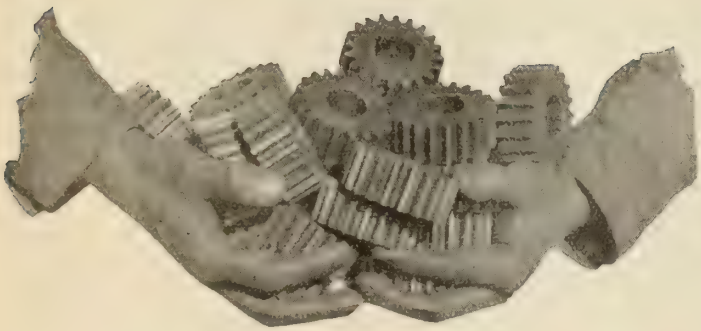
Good



Gears

WRITE US

Hamilton Gear Co., Ltd.

Van Horne St., TORONTO

There's a Famous Five File for Every Kind of Work

And every one is made of high grade steel, and ground and cut for its particular purpose.

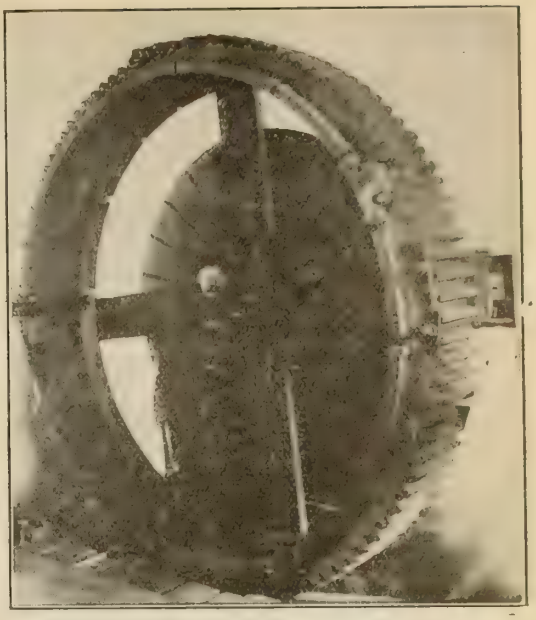
Give your men Famous Five Files to work with, and you will get good results.

Also teach them to turn in a file as soon as it becomes dull.

You do not need to be afraid to do this with Famous Five Files, because they will not grow dull quickly.

Specify them when ordering.

They are:



"HISCO" Moulded Gears

WHY pay for expensive patterns when you install new machinery that necessitates special gears? "HISCO" machine-moulded gears, while requiring no pattern, insure accuracy, dependability, quality, and the price is minus the cost of patterns—which in these days of high prices of lumber and labor is something to be considered.

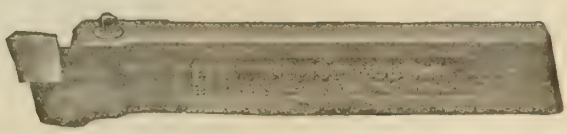
THE "HISCO" plant is equipped to produce machine-moulded gears up to 18 feet in diameter without patterns—and remember, very often the pattern costs more than the gears.

Write for our Estimates.

HULL IRON & STEEL FOUNDRIES, LIMITED

HULL - - CANADA

Announcing—



WILLIAMS' "Vulcan" Forged-Cutter Tool Holders give unequalled service to those who prefer the solid, forged-type of cutting tool. Each Holder, by the mere insertion of small High Speed Forged-Cutters is adapted to the heaviest service on Lathe, Planer, etc.

The economy and convenience of this line, when installed as standard shop equipment, is at once apparent, as all blacksmith work, to say nothing of the very considerable investment necessitated by heavy, solid forged-tools of costly High Speed Steel, is eliminated.

Absolutely simple in construction, yet possessing all the advantages of the solid tool without its expense.

Cutters, drop-forged from the finest grade of High Speed Steel, in stock in a great variety of sizes and types, finished and hardened ready for use. Ask for descriptive booklet.

J. H. Williams & Co., 45 Richards Street, Brooklyn, N.Y.

Special Belt Problems

Drives that require speeding up or those called upon to give increased power, ofttimes present problems to the engineer or master mechanic. Again, a drive may be required to run in an atmosphere laden with Dust, Gas, Steam or Acid Fumes where a belt could not be considered. Our engineers are ever ready to help on such problems and our experience is yours for the asking.

Save by securing data and estimates of "Morse" Drives.

Speeds and Feeds?

The idea of using **any** speed or feed is poor business.

For increased production and cost reduction in manufacturing grinding it is essential that the correct speeds and feeds be used.

All our Plain Grinding Machines have a large range of INDEPENDENT Speeds and Feeds that provide for the correct ratio for every job.

Obtaining the correct speed and feed is but the quick manipulation of the proper levers on

BROWN & SHARPE
Plain Grinding Machines

The cost sheets of manufacturers the world over best show the satisfactory results of this control.

For Roofs—old and new

Scores of buildings need roofing
Scores of roofs need repairing

BRANTFORD
Asphalt Slates

Made of the same material as Brantford Crystal Roofing, but in individual size shingles. Crystal Roofing has a crushed slate surface of red or green, 80 lbs. per square. Brantford Asphalt Slates are in great demand.

ASBESTOS FIBRE
(*Liquid*) CEMENT

—a rubberlike adhesive and tough preparation made from finest asbestos fibre, creosote and durable oils. Makes any roof, no matter in what condition, absolutely proof against climatic conditions. Easily applied over any kind of roof, metal, gravel, paper or composition.

Asbestos Sheathing

With fire prevention uppermost in the minds of everybody from the school-boy up there is no doubt a growing tendency to fireproof buildings. Asbestos Sheathing is a recognized fire-prevention material. Recommend it to builders.

Jewel Roofing

Comes in 1, 2 and 3-ply guaranteed respectively for 3, 5 and 8 years. We think it is the best value on the market for this quality of roofing.

Excelo Roofing

—a better grade roofing with a longer guarantee. Comes in 1, 2 and 3-ply, guaranteed for 5, 10 and 15 years respectively. Place your orders early.

We also carry a full stock of regular lines of plain and tarred felt in 10, 12 and 16 oz. weights.

WRITE FOR PRICES

Rice Lewis and Son, Limited, Toronto

CATARACT BENCH LATHES AND ATTACHMENTS

Cataract Bench Lathes are finely constructed precision tools, with responsive controls, simple adjustments and numerous convenient attachments adapting them to a wide variety of work. **Study this illustration.** Note the base, the circular bed, the sliding tool post, massive head stock (indicating strength), range of gears, special tailstock, arrangement of gears.

LANDIS Durability Shows on the Big Jobs

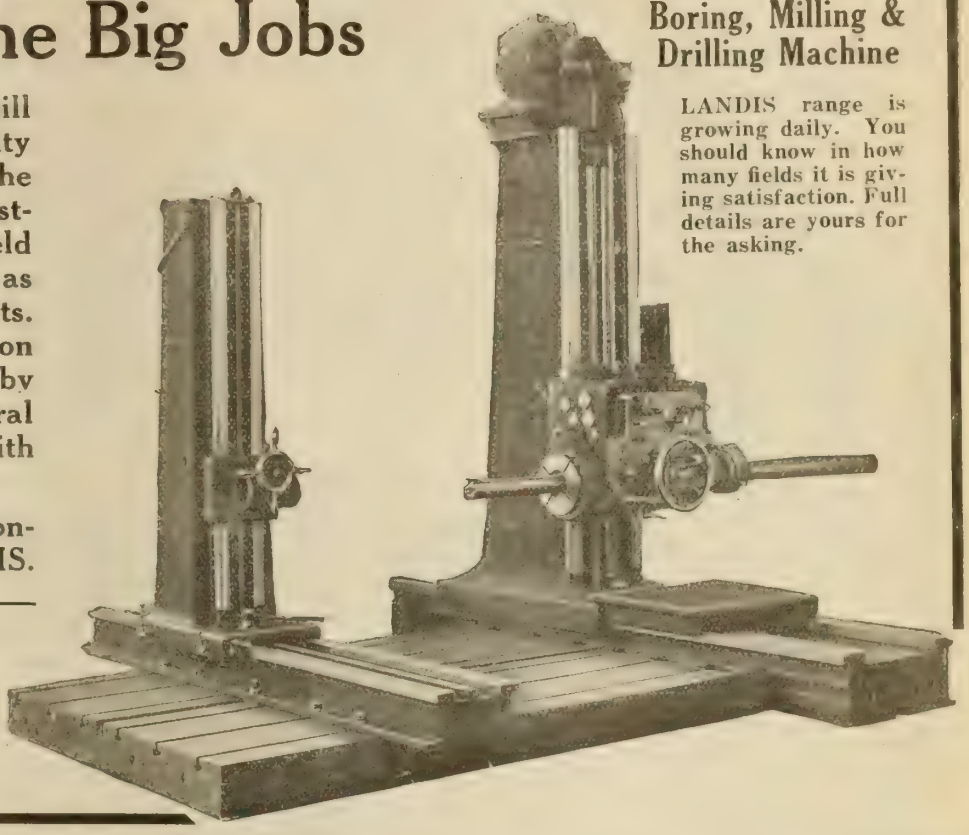
LANDIS

Boring, Milling & Drilling Machine

LANDIS range is growing daily. You should know in how many fields it is giving satisfaction. Full details are yours for the asking.

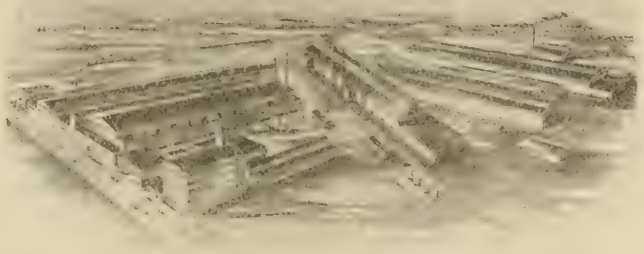
Shipyard and steel mill work will test the durability of any machine tool. The big, awkwardly shaped castings must be as rigidly held and accurately machined as smaller and plainer parts. The LANDIS proves up on this work and saves time by reason of allowing several machining operations with one set up.

Design, material and construction tell in the LANDIS.



Landis Tool Company
Waynesboro, Pa.
New York Office, 50 Church St.
AGENTS:
Dewstoc Machine Co., Birmingham, Ala.; Harron, Rickard & McCone, San Francisco and Los Angeles.

A Plant Equipped in Every Detail to Suit Your Every Need



STEEL PRODUCTS

Open Hearth, Basic and Acid, Electric and Alloy Steels.

CASTINGS

For Ships, Railways, Rolling Mills, Gears, Machinery and Ingots to 35 tons.

RAILWAY SPECIALTIES

Penn Couplers, Bolsters, Truck Side Frames, Draft Gears.

FORGINGS AND BILLETS

Heavy Ship Forgings, Locomotive and Car Axles, Miscellaneous Forgings.

PLATES

Plates and Heavy Sheets to 30 inches wide, Soft and High Carbon, Automobile Plates and Sheets.

AGRICULTURAL STEEL

Soft Centre and Solid Plow Steel, Harrow Discs, Shovel Steel, Cultivator Blades.

DOMINION FOUNDRIES AND STEEL, LIMITED
HAMILTON, CANADA

You're not merely buying tools—

You're buying SERVICE when you order

BUTTERFIELD Quality

Supply your mechanics with Butterfield Tools.

When a skilled mechanic looks on the shank of a tool and sees the name "Butterfield," he knows, from past experience, that he has been provided with a tool that will be equal to the most exacting work. You'll be money ahead in the long run by giving them quality tools. A trial is convincing.

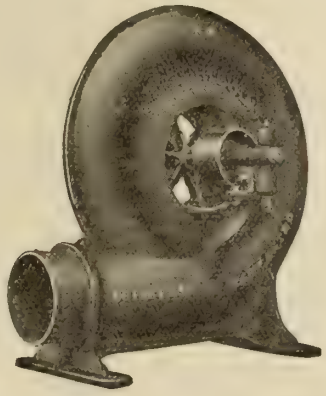
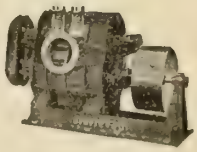
STEEL PRESSURE BLOWERS

Medium Pressure Blower



Low Pressure Blower



High Pressure Blower

For All Purposes

THO designed originally for supplying air to cupolas and forges Sturtevant steel pressure blowers are now used for all purposes where pressures up to 16 ounces to the square inch are to be maintained; and where air is to be forced for long distances. Regularly built with horizontal discharge but can be readily made for down blast or up blast. Built in all sizes and may be belt, motor, engine, or turbine driven. Operating and upkeep cost is remarkably low as proven by actual performance in many long term (30 years and more) installations. Design and construction are typically Sturtevant—supreme! Blast wheel is made of refined steel and galvanized to prevent rust. Wheels are accurately balanced and run smoothly when driven at high speed. Bearings are each cast in one piece and are lined with highly durable non-heating white metal. Write for catalogue.

For Self-Promotion And Sales Promotion Use These Publications

POWER HOUSE

Twice a month—$1.00 per year now —$2.00 January 1.

Serves the power plant engineer—Steam, Electric Refrigeration, Hydraulic.

CANADIAN MACHINERY

Weekly—$3.00 per year.

Covers the metal working field—serving shop executives, purchasing agents and owners. First-class mechanical paper and market paper combined.

CANADIAN FOUNDRYMAN

Monthly—$1.00 per year.

A paper for the foundry owner, superintendent and foreman. Claimed by its readers to be unexcelled.

MARINE ENGINEERING

Monthly—$2.00 per year.

Interprets marine engineering in its broad sense, serving the shipbuilders, navigation companies and their officers. (The editor holds an extra first-class B.O.T. certificate).

SMALLEY GENERAL

No. 1 FLANGE THREAD MILLER

This Flange Thread Miller Is a *Real* Cost Cutter

It is the most efficient and reliable tool of its kind because of its simplicity of design, the care used in its manufacture and its many universal features.

With this perfectly-built tool you can mill flange threads with fewer rejects, with greater accuracy, with greater speed and at a lower cost than can be obtained by any other method of thread cutting.

While the work held in the chuck makes one revolution, the milling head is moved back on the ways, a distance amounting to the pitch of the thread to be milled, and when a multiple tooth hob is used, the thread is complete at ONE revolution of the work. This is but one of many features of the Smalley-General Flange Thread Millers.

Skilled Labor Not Necessary

It is a mistake to believe that the adoption of a thread miller of the Smalley-General type requires skilled, high-priced help. The machine being simple and convenient to operate, ordinary intelligent labor can turn out accurate work without trouble.

Wherever the Smalley-General Thread Miller is introduced a reduction in tool room expense follows in its wake. Don't you believe it is worth investigating?

There are several other points about the Smalley-General Flange Thread Miller that you should know about. Our comprehensive circular, and any other data you may require, will be quickly sent upon request.

HENDEY

Improved Centering Machine

ASSURES perfect results at low cost. The distribution of metal insures the maximum strength with the least weight of machine; in this manner we have conserved on material and hence on machine cost.

Here are a few of the **Hendey** Improved Centering Machine features:—

The head is rigidly clamped to the bed, giving permanent alignment of spindle. Spindle is large in diameter with ample bearings, having felt oilers. Front journal is made taper, after the well-known pattern of our lathe and milling machine spindles.

Jaws of vise and supporting block are made of steel, hardened and ground.

Jaws are aligned from spindle by proof bar carried in spindle. This care in alignment is exercised in order to enable machine to accurately centre stock for finishing purposes after coming from turret lathe or screw machine.

Parallel movment of vise and block is maintained by means of the connecting rod and bevel geared drive at back of machine, controlled from handle at front of vise. No matter what the diameter of bar may be, it will always be supported in a horizontal position. Saddles are gibbed and fitted to bed, and provided with binding handles for ready clamping in position.

Capacity of machine is from 5-16 to 4 inches inclusive.

Hendey centering machine on centering work in plant of Can. General Electric Co. on all sorts of portions of their product.

Let us send our circular

QUALITY Foss SERVICE

Foss MACHINERY AND MILL SUPPLIES

Tungsten
Hack Saw Blades

They master all cutting-off difficulties. Efficiency and economy are the two things that every manufacturer is working for to-day, and TUNGSTEN HACK SAW BLADES, from this standpoint, are the best that can be bought.

In ordering blades, be sure to specify just what work they are expected to do, so that we can furnish a blade that will exactly suit your requirements.

FLEXIBLE BLADES FOR HAND USE

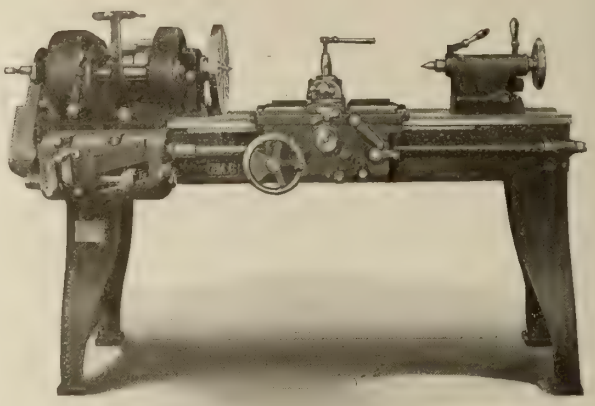
C.M.C.



ENGINE LATHES
GREAT and SMALL

Are of the same standard of quality—the best. Our 36″ Engine Lathe shown at the bottom of this advertisement is built with the same care and thoroughness as the fine 14″ tool maker's lathe illustrated above. The smaller lathe has the same proportionate strength and rigidity as the big brother.

Proper design, good material, skilled workmanship and rigid inspection result in that standard of perfection synonymous with our trademark C.M.C.

Intermediate sizes are of equal quality and share in the enviable reputation.

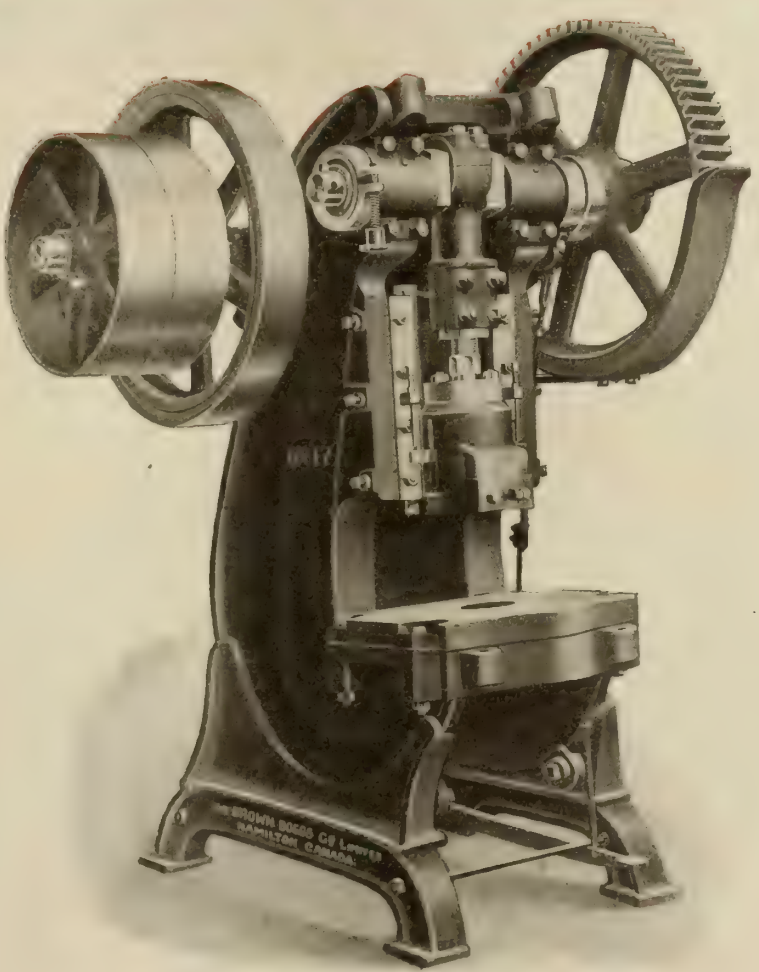
CANADIAN MACHINERY AND MANUFACTURING NEWS

A weekly newspaper covering in a practical manner the mechanical power, foundry and allied fields.
Published by the MacLean Publishing Company, Limited, Toronto, Canada

Vol. XXII., No. 23. Publication Office: Toronto, December 4, 1919. Subscription Price $3.00 per year.

For Your Pressing Needs



No. 215 Inclinable Geared Press

If you want maximum production install "BB" Presses. Shafts are made from high grade carbon steel forgings carefully heat treated. All wearing parts of clutch are tool steel. Clutch is four point instantaneous type.

The Brown-Boggs Co., Limited
Hamilton, Canada

STAYBOLT TAPS

The Better the Man, the More He Appreciates Them—

Not only good when new, but heat treated and seasoned to maintain this goodness. Can be ground on face of cutting edge without affecting their size. That's why you'll find Pratt and Whitney Stay Bolt Taps on the job long after cheaper "just as good" tools are buried in the scrap pile.

Threads accurately and cleanly cut, with the least expenditure of time and effort, are other reasons why these better Taps are favorites in the shop.

If you've used them before, you know just how good they are. If you haven't, send us your first order—we know you'll be back for more. They're carried in stock in our sales rooms in all large cities.

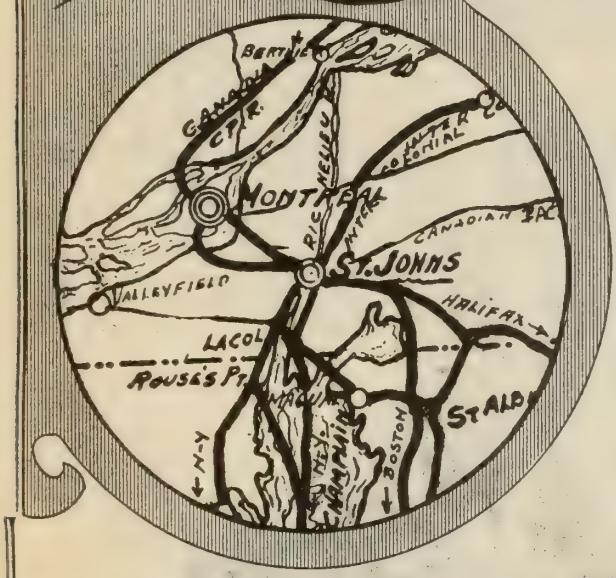
Canadian Machinery and Manufacturing News, December 4th, 1919. Vol. 22, No. 23. Published weekly at 143-153 University Ave., Toronto, Canada. Subscription price in Canada, $3; United States, $3.50. Entered as second-class matter at the Post Office Department, Ottawa, Canada. Entered as second-class matter July 1, 1912, at the Post Office at Buffalo, under the Act of March 3rd, 1879.

The City of ST. JOHNS, QUEBEC



ITS LOCATION

It is located in the Province of Quebec which, as regards industries, is to Canada what New England is to the United States. (It is 27 miles, or 45 minutes, from Montreal).

ITS RAILWAYS

The two big railroad systems (double track) of Canada, the Canadian Pacific and the Grand Trunk Railways, pass through St. Johns, where merchandise can be shipped and exported anywhere upon the globe with dispatch. These railways are connected by a terminal switching system: charges at exceedingly low rate. All Eastern U.S. railroads are connected with St. Johns.

Direct Connections with Docks at Montreal

Goods can be exported direct by steamers to European, South African, South American and West Indian Ports.

St. Johns has long been recognized as the cheapest labor centre in Canada. Reasonable rents and living costs are keeping it so even in these times.

No other locality offers the following inducements to new industries---but we do

Exemption of taxes for fifteen years' period that is subject to extension. All public improvements which you may require, such as extension of streets, sidewalks, waterworks and sewerage; five per cent. bonus to you on your payroll for five years and if you wish we will advance this to you to be applied to the purchase or erection of any building suitable to your purpose.

ANNOUNCEMENT

THE ALGOMA STEEL CORPORATION, LIMITED, take pleasure in announcing to their customers and the Canadian trade that in accordance with the widespread desire throughout the Dominion that there should be obtained in Canada with Canadian labor, a much larger proportion of the requirements of this country in STEEL SECTIONS for STRUCTURAL PURPOSES, CAR CONSTRUCTION, SHIPBUILDERS' REQUIREMENTS, etc., they are just completing extensive alterations and additions to their rolling mills, and on or about 1ST NOVEMBER, will be ready to produce and ship American Standard Sections of BEAMS and CHANNELS up to and including 15", all standard sections of ANGLES from 6" x 6" down to 1¼" x 1¼", ZEE BARS for car builders and general purposes, small and large ROUNDS and SQUARES, and FLAT BARS up to 14" wide. The quality of the product is already well known to the trade, and is exclusively steel made by the Open Hearth process. and can be furnished in all grades from the softest rivet stock to high carbon special spring material.

The following are the sections which will be rolled:---

ANGLES—Equal Leg—
6 x 6"—5 x 5"—4 x 4"
3½ x 3½"—3 x 3"
2½ x 2½"—2¼ x 2¼"
2 x 2"—1¾ x 1¾"
1½ x 1½"—1¼ x 1¼"

ANGLES—Unequal Leg—
6 x 4"—6 x 3½"—5 x 4"
5 x 3½"—5 x 3"—4½ x 3"
4 x 3½"—4 x 3"—3½ x 3"
3½ x 2½"—3 x 2½"—3 x 2"
2½ x 2"

BEAMS—
15", 12", 10", 8", 6", 5", 4", 3".

CHANNELS—
15", 13", 12", 10", 8", 6", 5", 4", 3".

ZEES—
3¼ x 5 x 3¼ x 5/16
3 5/16 x 5 1/16 x 3 5/16 x ⅜"
3⅜ x 5⅛ x 3⅜ x 7/16"
3 1/16 x 4 x 3 1/16 x ¼"
3⅛ x 4 1/16 x 3⅛ x 5/16"
3 3/16 x 4⅛ x 3 3/16 x ⅜"
2 11/16 x 3 x 2 11/16 x ¼"
2¾ x 3 1/16 x 2¾ x 5/16"

ROUNDS—
All sizes from ½" up to and including 4".

SQUARES—
All sizes from ½" up to and including 3".

FLATS—
All sizes from 1 x ¼" up to and including 14" wide.

MINE RAILS—
All sections from 12 lbs. up to and including 45 lbs. per yard.

PIG IRON—
Machine cast FOUNDRY MALLEABLE and BASIC.

SULPHATE OF AMMONIA.
NITRE CAKE.

For the better convenience of customers who may find it necessary to secure rush shipments of particular items, they contemplate keeping a large stock of all the various standard sections constantly on hand, and to this end extensive warehouse facilities are being prepared.
Your enquiries and business will be appreciated.

Every Emery Wheel With Its Own Dresser

Desirable, isn't it, now that cost is no objection? For with an inexpensive Desmond-Stephan Dresser for every wheel, every wheel will be touched up frequently and so kept true and equal to its original cutting efficiency.

For all ordinary shop grinding wheels specify **"Diamo-Carbo"** —the perfect diamond substitute.

For large, coarse, hard wheels ask for the **"Desmond-Huntingdon."**

Sherman Corrugated, 2 sizes
Norton Zig-Zag, 2 sizes

"We have cut our cleaning time more than half"...

"THE OAKITE in that tank does it.

This Advertisement is one of a series based on actual occurrences. M. M.

"The day the Oakite man came here, we were cleaning steel automobile bumpers which were covered with emery and oil. We were about 300 behind and were only turning out about five or six an hour, because we had to brush them.

"The Oakite man made up three tanks with Oakite and we caught up on our back work in *one day*—eliminating brushing—and we have never been a single piece behind since."

In seeking advice on cleaning problems, look for broad experience and ability. It is the surest, safest way to find sound counsel, yes—and plans, methods and materials too, that fit your particular needs.

How may we serve you?

OAKITE MANUFACTURED BY OAKLEY CHEMICAL CO. 44 THAMES STREET · NEW YORK

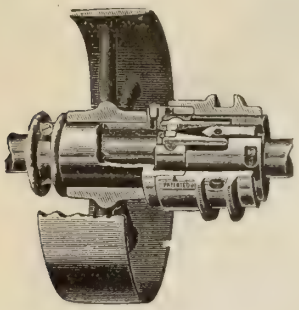
THE JOHNSON FRICTION CLUTCH



Standard Single Clutch with Pulley Mounted on Hub —Clutch Engaged.

MANUFACTURERS who are particular about keeping an established reputation equip all their machines with Johnson clutches. They recognize that superiority must be consistent in order to count. And Johnson clutches assure them of uniformly good service wherever they are installed.

Other clutches might work well in some cases—but Johnson clutches are *sure* for all purposes. We study each application on its own conditions, and build a clutch that is just right for the job.

When you are tired of experimenting, let us have a chance.

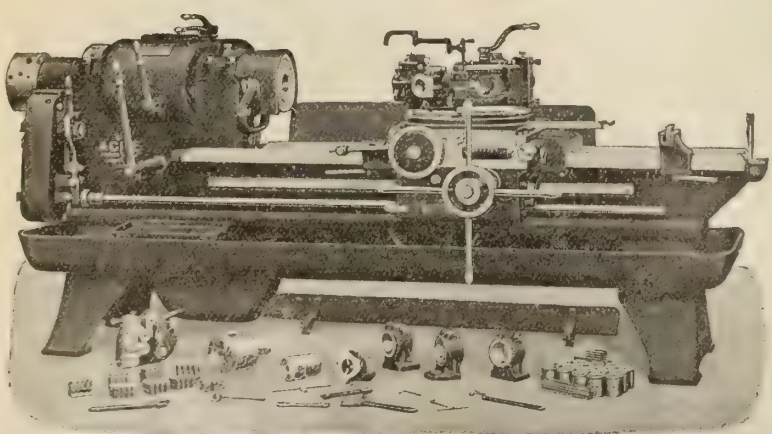
Doubly Efficient—Does Both Bar and Chuck Work

This Cincinnati Acme Flat Turret Lathe is a double-production, geared head machine of the sliding gear type. It operates on minimum power because the only gears running are those doing the actual work.

This machine saves remarkable time and labor machining either bar work or chuck work up to 16 in. diameter.



3¼ in. x 36 in. Flat Turret Lathe, Equipped for Bar Work.

Head is cast solid with the bed. You know what that means: accuracy, rigidity, constant and perfect alignment of spindle with vees, upon which the turret carriage travels.

We also make a full line of Screw Machines and Turret Lathes.

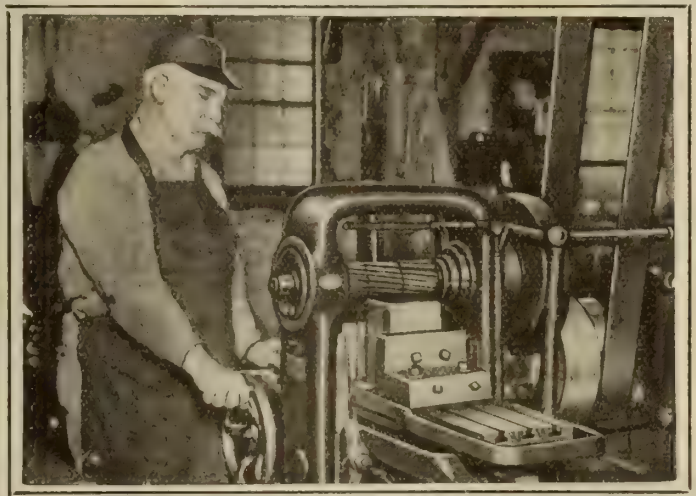
BRIGGS MILLER

Keeps Five Die Sinkers Going



HERE you see the Briggs Miller Squaring Die-Blocks, and it is working so fast it keeps five die sinkers going.

Some are new, squared from the rough; some are old, annealed, cut down and made over; some are oblong, some square, in sizes up to 9 inches. This Briggs Miller has been squaring blocks for four years; has never given any trouble. When cutters get dull the operator has another gang ready to go on with the work. Unusual rigidity accounts for Briggs' higher efficiency.

Don't you think you could use this tool to advantage in your shop? Write for the details.

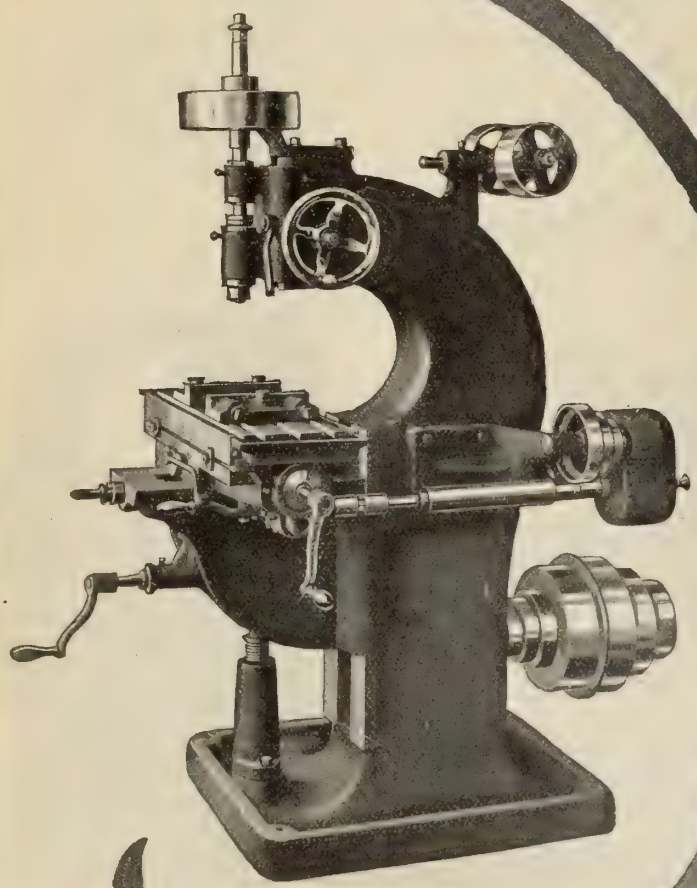
BRISTOL

Bristol Vertical Milling Machine

A Tool of Large Capacity



Ball Bearings are used at the most important points making it a free running tool, which, combined with its being a belt-driven machine, makes it capable of turning out work on which an extra smooth finish is desired.

The longitudinal table feed is controlled by the gear change box which gives six different feeds for each change of spindle speed. A stop to gauge with micrometer adjustment is used on the head to regulate the depth of cuts.

Learn all about its production capacity.

Write for bulletin giving fullest particulars.

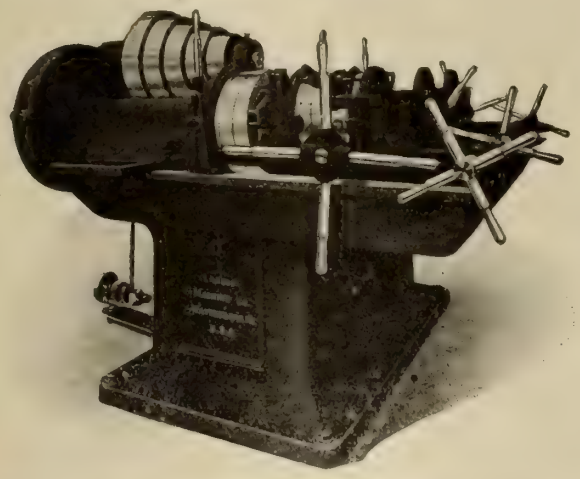
The Landis Die—A Sure Economy Investment

Do you cut threads? If so, are you using the Landis chaser which is tangentially disposed to the stock? This one principle alone makes the Landis entirely distinct from any other threading tool.

The Landis chaser does not rub or push off the thread; it cuts it and the results—more accurate threads, higher production, less consumption of power and less cost per thread.



The chaser is four inches long. When grinding 1/32" is removed, thereby permitting the chaser to be ground from 90 to 120 times. Remember also, that to renew the chaser when dull, grind it only as annealing, hobbing and retempering are never necessary.

A Landis Head or Machine installed in your plant will convince you as it has many others, that it is the correct method of cutting threads, that it is the most productive, and that it is the most economical.

Write for our catalogue—it is free

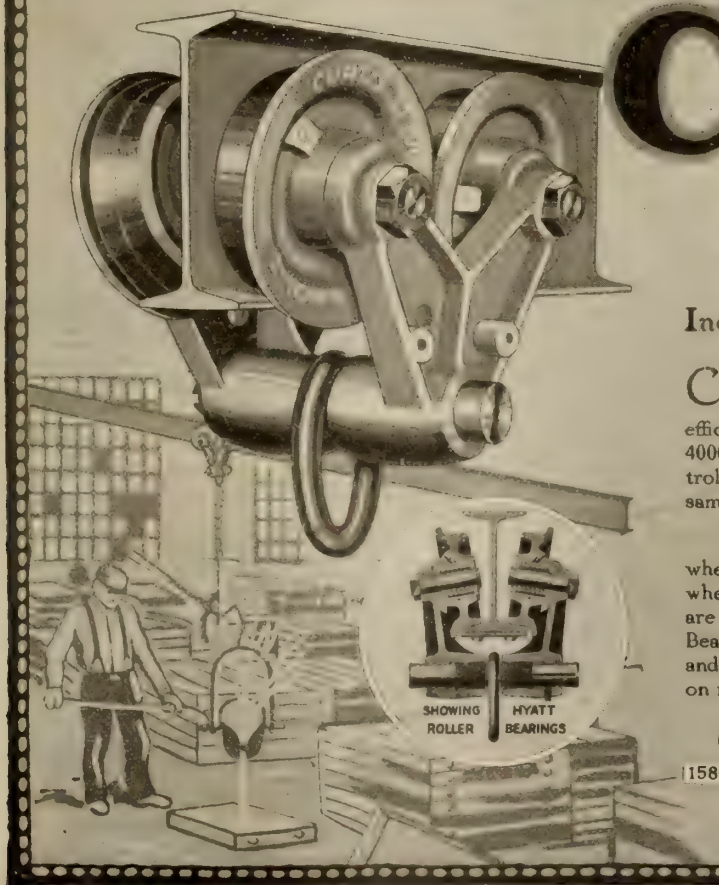
WAYNESBORO, PA.

CURTIS TROLLEYS



Increase Production—Save Man-Power

CURTIS Single I-Beam Trolleys are being used by progressive firms demanding the highest operative efficiency. A Curtis-Hyatt Roller-Bearing Trolley with a 4000-lb. load can be moved by a 50-lb. pull, while ordinary trolleys require nearly twice as much power to move the same weight.

Curtis Trolleys are constructed with large inclined wheels and self-equalizing steel side-frames—so that each wheel always bears its rightful proportion of the load. They are equipped with shock-absorbing Hyatt flexible Roller Bearings—which make the trolleys easy-starting, easy-rolling and long-lasting. Full information and descriptive literature on request.

ELECTRITE

High Speed Steel

SEVERAL factors combine to make this high-speed steel a triumph of the steel-maker's art; Electric Furnaces — entirely infallible, automatically regulated, delivering the same result time after time.

Uranium — This rare element, cousin to Radium, effects a profound change in the texture and quality of the steel.

Added to these, the constant care and skill of years of steel-making experience make the result of each melt a foregone conclusion.

FOR GRINDING SMALL, SHORT WORK

The Heald No. 85 is a new, simple, productive machine for small, short work. It is designed so that movement of the pilot wheel to the right draws the wheel from the work and automatically puts on a brake, stopping the workhead and shutting off the water. It is furnished with a quick-acting collet with a capacity of 3/8″ to 3″ in diameter.

The table is provided with positive stops, enabling the operator to grind up to a shoulder. The machine is also equipped with a flexible idler, automatic wheel guard, water attachments and simple single countershaft.

Peerless HIGH SPEED

The Standard Metal Saw of TO-DAY

While labor is demanding more and more, manufacturers are demanding machines of greater output. The "Peerless" meets that demand. It is the standard metal saw of TO-DAY.

With its rapid cut and various time-saving features, it easily increases production from 50 to 100 per cent. With its automatic feed, straight line pull, positive blade clamp and general rigidity, it gets the maximum results of which a blade is capable and reduces breakage to a minimum.

OUR SIX-SPEED GEAR BOX

(not shown in cut) further increases output and saves blades wherever soft steel or metals of varying degrees of hardness have to be cut. The "Peerless" is furnished either with or without this feature, also with or without motor.

A trial order at our risk and expense is convincing

Individuality

RED-CUT SUPERIOR HIGH SPEED STEEL

A GREAT MAN wrote this: "I'm called away by particular business, but I leave my character behind me." And nobody had to guess whose character it was. Even if the familiar Red Cut label should disappear there would be no doubt as to the character of the steel that remained. More than ever would the quality shine forth in the results when it was worked. Adherence to the highest standard with an unvarying uniformity has placed a well merited reputation all its own on

MALLEABLE AND CAST IRON PIPE FITTINGS

The Brand That Has The Quality

"Quality" and "Reliability" are two essentials demanded of *Cast Iron* and *Malleable Fittings*, by all sanitary and heating engineers.

Time and money are lost by improperly made fittings. All our cast iron and malleable fittings are properly recessed and every fitting bears the above trade-mark of quality.

We make a complete and full line of both flanged and threaded fittings from ⅛-inch up, and can make deliveries from stock, both standard and extra heavy.

When ordering from your jobber be sure you buy---"the brand that has the quality." They are different. A trial order will convince.

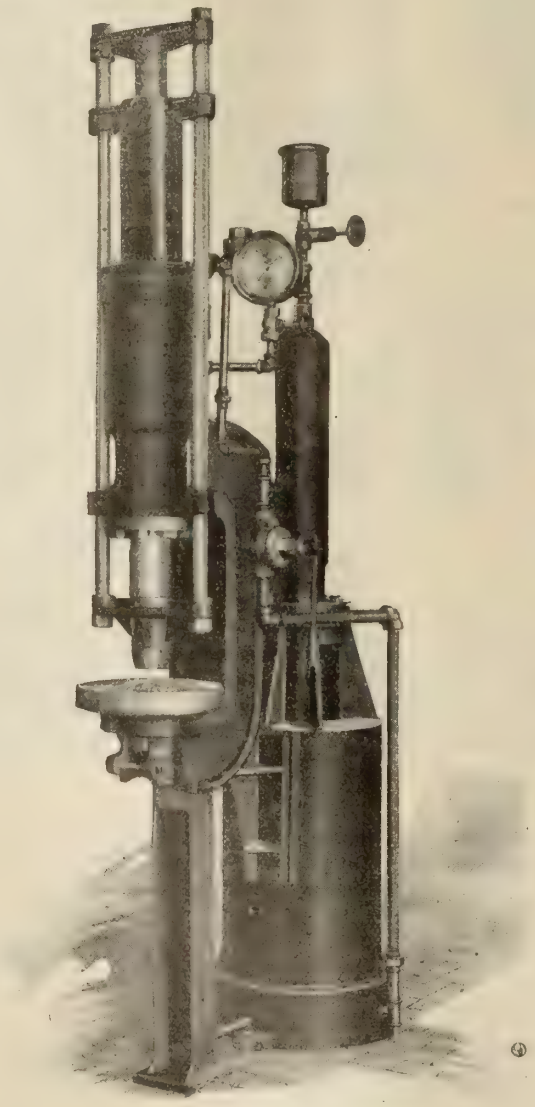
"METALWOOD"

DESIGNS and
DEVELOPMENTS



The "Metalwood" line of these Quick Operating Hydro-Pneumatic Presses comprises a variety of styles, types and sizes.

By performance through a period of years, these presses have established themselves in a wide range of industries as standard tools for light straightening, broaching, forcing and assembly operations.

The "R-149" style press of 20-ton capacity shown here is described in our bulletin B-47.

METALWOOD MANUFACTURING CO.

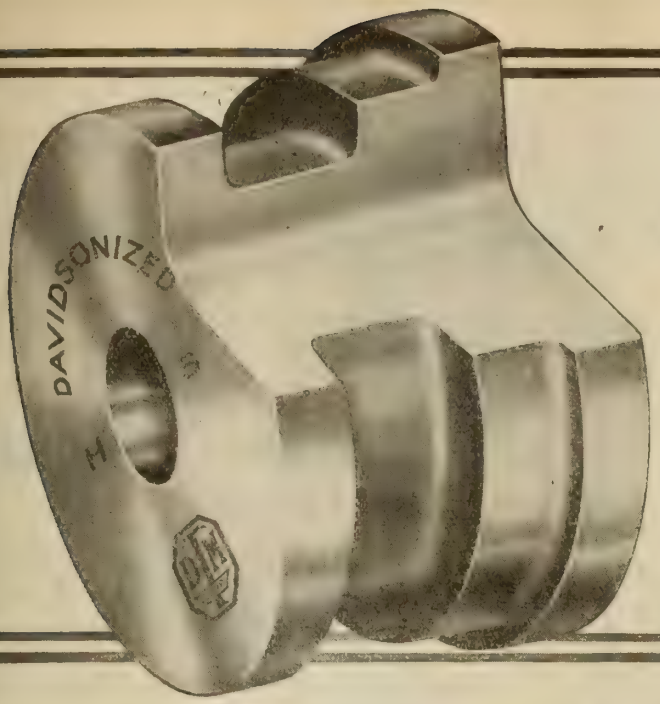
DETROIT, MICHIGAN

EXCLUSIVE SALES REPRESENTATIVES:

Canadian Fairbanks-Morse Co., Ltd., Montreal and Toronto; R. E. Ellis Engineering Co., 621 Washington Blvd., Chicago; Fairbanks-Morse & Co., Inc., 30 Church St., New York City; Sherritt & Stoer Co., Inc., Finance Bldg., Philadelphia, Pa.



Not Simply "Better" but Eight Times Better

SUPERINTENDENT B---, of a great plant in Central New York, writes us this report on

DAVIDSONIZED Form Tools

"Turning and forming Chrome Vanadium Steel at 80 ft. per minute feed .030 the Davidsonized tools ran for 80 hours as against 10 hours runing with five of the best known brands of Tungsten and Cobalt steel on the market.

"We then increased the speed to 120 ft. per minute with the following results:—

"Davidsonized" cast tools ran for		**22 hours**
No. 1 Competitive tool		**4 "**
No. 2	**"**	**4¼ "**
No. 3	**"**	**3¼ "**
No. 4	**"**	**3¼ "**
No. 5	**"**	**4 "**

"The Davidsonized tools required .002 grinding. The competitive tools required from .007 to .015 grinding."

DAVIDSONIZED FORM TOOLS are as far ahead of competition as DAVIDSONIZED Milling Cutters and other Tools of Davidsonized Steel.

All aside from the increased production, reduced labor costs and reduced overhead made possible by such a performance as the one described above, think of the saving in tool costs through completing the same work with one-fifth to one-eighth as many tools as before!

The plant which is using DAVIDSONIZED TOOLS to-day, is jumping ahead of competition. Soon their use will be so general that the plant which does not use them will be lagging far behind.

Better try them out **now**.

Notes On Grinding

NORTON COMPANY WORCESTER, MASS.

No. 52A

GETTING THE MOST OUT OF THE WHEEL.

DID YOU EVER stop to reason why one operator on the same work, same machine and same wheel, gets 100 pieces ground with one truing while another only does 50? That is just where the art and knack creep into grinding. You cannot tell any one how to obtain such results; that must come with experience. It is possible, however, to point out a number of little things which, if observed, will form a foundation on which to build such experience. The following is an interesting instance demonstrating this fact.

Noticing that an operator in an automobile factory handled the wrist pins which he was grinding in a very unusual way, a Norton engineer who was present inquired how many he was doing in one hour. When he replied, "Twenty-five," it was evident that something was wrong because on this operation it should be possible to do at least forty or fifty per hour. The operator went a little further than this and stated: "I am in trouble and need help. You know the price on this job is $1.35 per hundred. The boss says I ought to make $5 per day. The company want more parts and I need the money, but I can't make out."

The piece being ground was about 6" long. The operator fed a 1½" face wheel into the work five times, stepping over each time for roughing down the pin. Then when he was ready to finish he stroked the work, using the table power travel. The wheel, he claimed, wore away too rapidly, although it was a 36-K wheel and should be efficient for that particular job. It so happened that he was running the wheel on the fastest work speed and was not using the automatic wheel feed but rather fed the wheel in by hand, and in so feeding did it very irregularly.

It was a simple matter to fix this fellow up by changing the work speed so that it was considerably slower, which had the effect of making the wheel act harder. By stroking the work all the time the wheel cut more uniformly, and secondly lasted longer. Using the automatic wheel feed provided time for him to prepare another piece of work for the grinding machine, placing it on the arbor, and also made the wheel stand up better, not suffering from the abuse of feeding first .001" and then .010". Later in the day the engineer returned and the operator greeted him with a broad grin: "I did 78 pieces since you left." That was at the rate of forty per hour, removing .025" stock to .001" limit, the material being case hardened steel.

This is only one of the many illustrations that could be recorded from actual experiences where the principles of grinding were not thoroughly understood. So many times the wheel is blamed for something which, if properly used, would never cause trouble. Wheel action is a very delicate element in grinding, and responds very rapidly to changes in speeds of either work or wheel, changes in radial depth of cut or arc of contact of wheel with work. A great many fail to attain high efficiency in wheel service because these laws are not observed.

If you suspect that there is something wrong with the production results you are obtaining, why not write to our Sales Engineering department and put the problem up to them? They will be glad to advise you from experience gained in their many years of experimenting with work perhaps quite similar to yours.

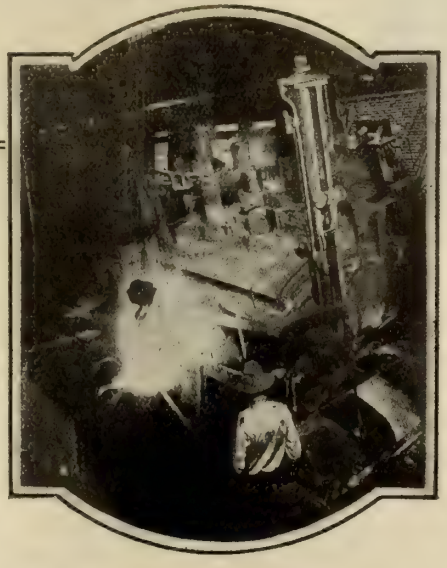
Types of Greaves-Etchells Electric Furnaces

A Percentage of the Total Heat Generated is Released in the Hearth of the Furnace

By W. F. Sutherland

Long Refractory Life, Stirring of Bath and Good Power Control Are Thus Accomplished



THE electric furnace is a metallurgical instrument in which any desired temperature up to the point of fusing of the best refractories obtainable can be attained and perfectly controlled. At these high temperatures chemical reactions take place more rapidly than in other processes and the most refractory metals and alloys can be reduced to fluidity. The flexibility of the electric furnace also gives it a great advantage over former processes and the superior quality of the product is very marked.

Scrap containing valuable alloying metals, such as nickel, chromium, tungsten, vanadium, etc., can be melted without the loss of these elements and works that have sold their steel swarf and scrap, cast iron borings, etc., at very nominal prices are installing electric furnaces and making their own castings formerly purchased. The charge can be made up entirely of scrap and turnings, no expensive raw materials being necessary except additional alloying metals if these are desired.

Steel from the electric furnace is finished off under a reducing atmosphere of carbon monoxide and a slag out of which metallic oxides have been reduced and is therefore singularly free from blow-holes and occluded gases when properly cast. This is due to the elimination of the gases that molten steel usually holds in solution; and the ease with which the steel can be poured into small and intricate castings, flowing smoothly like cream and sitting perfectly quiet in the moulds is largely due to its purity.

An electric arc furnace for steel making usually consists of a steel tank lined inside with refractory materials and fitted with working doors and tilting arrangements for teeming. Carbon or graphite electrodes of a suitable section are inserted through the roof or walls and may be regulated either by hand or automatic control. A high tension supply is brought into a transformer house adjoining the furnace and transformed down to a low pressure alternating current for operating it.

The method by which the heat is introduced into the steel bath of the furnace is of much importance. The heat is generated in most types of furnaces by means of electric arcs formed between the electrodes themselves or between the electrodes and the metal bath. A disadvantage of this type of furnace is that the heat is applied at the top of the charge only, which is superheated, while the bottom may be comparatively cold, causing serious metallurgical difficulties. Several attempts have been made to overcome this objection by the use of conductive hearths and bottom electrodes, but no real improvement was achieved until the invention of the "Greaves-Etchells" system by two Sheffield engineers, H. A. Greaves and H. Etchells, B. Met., who had the advantage of operating both electrically and mechanically the leading types of furnaces installed in Great Britain.

It was the aim of the inventors to produce a furnace which would fulfil the following conditions:

(A) A system which would be applicable to any polyphase supply system, especially those of the higher commercial frequencies and which would maintain a steadier phase balance and higher power factor than furnaces then existing.

(B) The generation of heat in such a manner that it was applied as directly as possible to the metal in the furnace and did not superheat the slag and various portions of the lining more than was essential for maintaining the metallurgical conditions necessary for refining steel.

(C) Rapid melting and uniform heating of the charge.

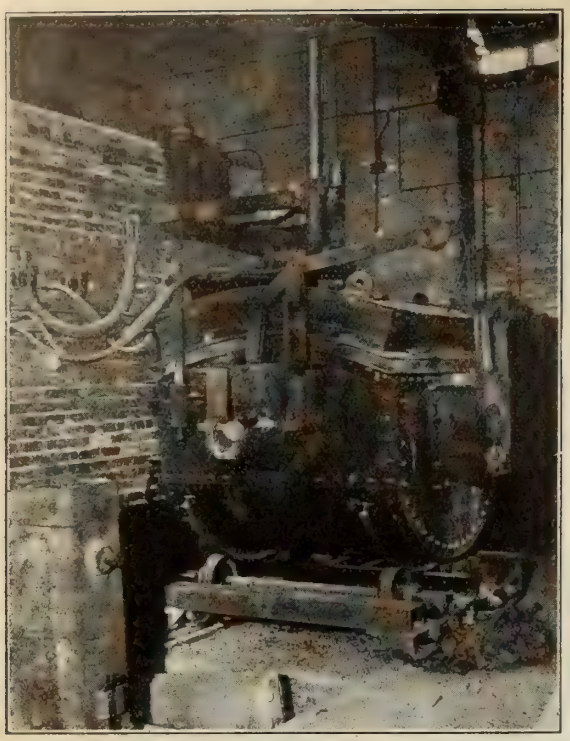
(D) Automatic circulation of the metal—giving uniform quality of steel—and avoiding the constant use of stirrers or rabbling.

(E) The construction of a furnace, which should be free from obvious mechanical defects so common in the earlier days of the electric furnace industry.

Construction of Furnace Hearth

In order to obtain an even temperature throughout the bath of molten metal in the electric furnace, it was realized that heat must be applied below as well as above the bath. Two phases of a three-phase low tension supply are connected to their respective upper graphite or carbon electrodes, while the third phase is connected to the bottom of the hearth. The current flowing through the hearth generates a considerable amount of heat immediately below the liquid in the most efficient manner, while the electric arcs arranged immediately above the bath maintain the slag and surface at the proper temperature.

The hearth lining is of special construction to achieve the above result and is never less than 20 in. thick. It is constructed mainly of dolomite, magnesite and other materials in such a manner that the electrical resistance is



ANOTHER INSTALLATION.

high at the inside of the bath and decreases rapidly to a negligible quantity at the outside. The outside of the furnace bottom remains cold, little or no heat being lost in this direction.

The importance of this special construction may well be emphasized, for if the hearth were constructed of a refractory material of uniform resistance at normal temperature when the inside face became heated by contact with the molten metal, its resistance would be materially lowered and most of the resistance would remain concentrated in the outer face. This would result in a material loss of heat since the heat generated by the passage of an electric current varies as the resistance.

Other furnaces with bottom electrodes are, of course, constructed, but in none of them does the hearth itself act as an electrical resister contributing heat to the underside of the liquid metal.

The results of the application of bottom heat are well worth noting. In the first place, liquid steel always tends to be sluggishly in the hearth of a furnace and if heat is only applied by the use of electric arcs above the steel, the slag and upper layers of metal become greatly superheated over the metal lying in contact with the lining. In order to get the metal at the bottom of the bath to the necessary degree of fluidity, it is necessary to overheat the slag and upper layers of metal to such an extent that great erosion takes place on the lining of the furnace at the slag line. A considerable amount of heat is also radiated upwards from the slag, quickly destroying the roof and upper walls of the furnace.

The use of bottom heating obviates these evils, through the reduction in the amount of energy liberated over the bath by the arcs and, of more importance, by the uniformity in temperature of the metal which results. The metal at the bottom of the furnace tends to reach a higher temperature than the average of the top of the bath and following the same laws on which all hot water radiating systems work the hot metal rises and the cold metal descends. This slow circulation takes place positively and continuously during the whole course of heat.

In furnaces not embodying this feature of bottom heating, it is stated that the lining in the vicinity of the electric arc tends to be damaged to a much greater extent than elsewhere. The enormous concentration of energy in the electric arc greatly superheats the adjacent slag and metal of the bath with the result above noted. By means of the slow circulation of the metal due to bottom heating, the heat supplied in the region of the arc is quickly absorbed by the moving streams of metal and distributed uniformly over the hearth of the furnace. Bottom heating, therefore, operates in the same manner as mechanically stirring or rabbling.

This feature also works to advantage in the manufacture of alloy steels. If lumps of cold metal or additions of alloys so difficult to melt as ferro-chrome or ferro-tungsten are thrown into the bath they will be dissolved at a reasonable rate and will soon be distributed throughout the liquid bath. Where no bottom heating is available much stirring has to be done in order to effect a complete distribution of the alloying materials and labor trouble is sometimes encountered, owing to the arduous nature of the work required from the melters. Another advantage of this slow circulation of the metal from the bottom of the furnace is seen in the rapid refining which is possible, as all parts of the molten bath are automatically brought into contact with the refining slags.

Electrical Features

The use of a three-phase current, two phases of which are connected to the electrodes, while the third is connected to the conducting hearth, introduces a variation in transformer connections which is of some interest and which results also in excellent operating characteristics.

This system of connection at first sight would appear to cause an out-of-balance load on the primary supply, but the system of transformer ratios, which is carefully calculated, is arranged so as to give a perfect balance when the upper electrodes are in equal adjustment. The three secondary transformer windings are arranged in star, while the primaries are in delta. The hearth is connected to ground as well as to one of the transformer windings, the neutral point of the transformer windings thus being above earth potential.

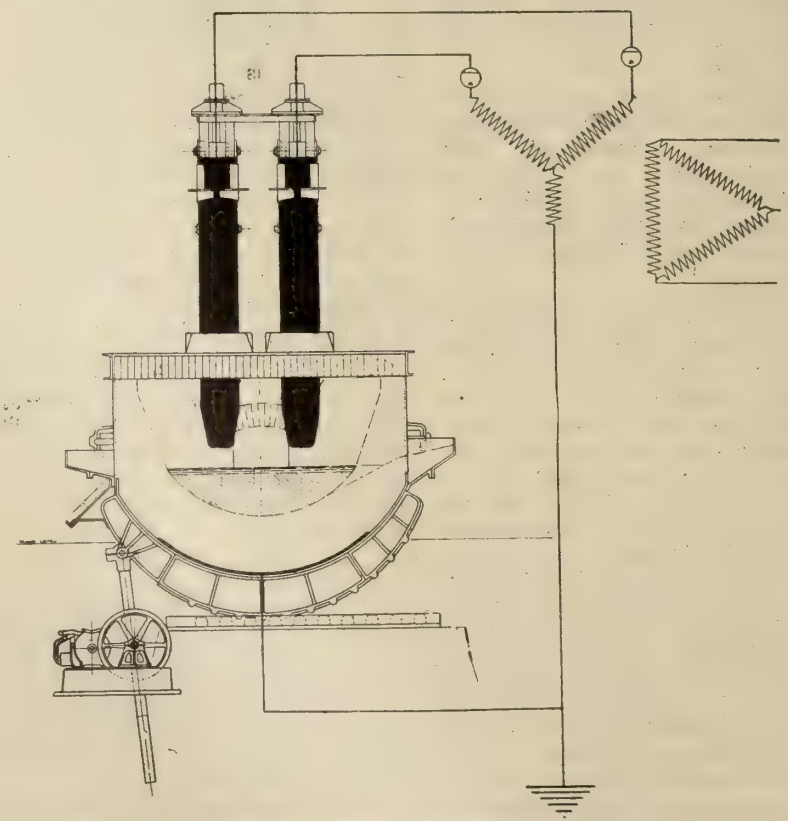


DIAGRAM OF CONNECTIONS.

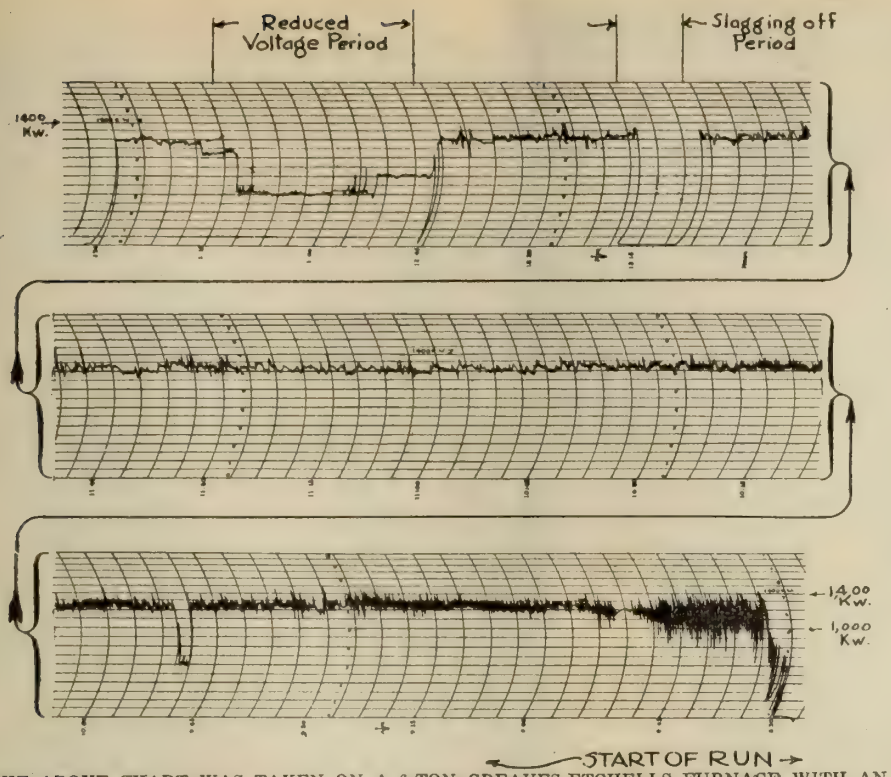


THE ABOVE CHART WAS TAKEN ON A 6-TON GREAVES-ETCHELLS FURNACE WITH AN ESTERLINE WATTMETER AFTER A SHUT DOWN OF 18 HOURS, USING COLD, MISCELLANEOUS SCRAP, AND REFINING UNDER TWO SLAGS. NOTE THE TIME INTERVALS AND THE ABSENCE OF SUSTAINED PEAKS.

The two electrode arrangement is used in furnaces up to three ton capacity. Above this size four electrodes are employed. This arrangement of the electrical equipment is equivalent to two individual and distinct circuits, such as are employed in the smaller furnaces. Each pair of electrodes with their respective transformer connections can be switched up individually, thus enabling one pair to be kept in operation, while adjustments are being made on the other pair. The total overload of the furnace under short circuit conditions is also considerably limited by this arrangement, because each half of the furnace trips its particular switch when its own pair of electrodes become overloaded, thus halving the percentage overload, which will be necessary to trip the whole adjustment.

The electrical connections possess several other interesting operating features. Close regulation of the load under short conditions is obtained without the use of excessive reactance in the transformers or externally in the form of reactance coils. In this system it is impossible for an electrical circuit to be closed without traversing the secondary windings of two transformers in series. These transformers each have a different phase angle and the short circuit current is opposed by two magnetic fields, neither of which is in phase with it. This automatically lowers the power factor as long as the short circuit persists and is thus equivalent to the momentary introduction of reactance. A strong buffer effect is thus obtained and the fact that there is always a permanent resistance in the path of the current through the hearth also limits the effect of short circuits.

The combination of these factors provides a very effective means of protecting equipment and supply system from the stresses resulting from short circuit conditions, while allowing a high power factor to be obtained on normal load. The sudden overload due to short circuit bumps seldom exceeds 25 per cent. of the load at which the furnace is normally running, as compared with very much higher figures on other types of furnace.

With this system it is also impossible to have any one phase or primary supply unloaded.

The operation of each electrode is independent of all others. The current from any one in passing through the arc completes its circuit through the liquid metal and through the lining of the furnace. It is thus not necessary or possible for the circuit to be completed through another electrode and complete individual control is obtained. This of one electrode dipping into the bath and upsetting its carbon content through the dissolving action of the steel on the tip of the electrode. This is important in the production of steel of accurate composition and it also prevents breakage of electrodes or mechanism when a cold charge is being melted.

The limitation of overloads effects a considerable economy in the cost of electrical equipment necessary.

The energy supplied to the furnace is regulated over a considerable range by raising or lowering the electrodes and this can be done by means of automatic regulators, of the Thury or Seede type, which maintain a current at a pre-determined figure or by means of the motors and controllers or by hand. Arrangements are also provided for varying the voltages across the arcs, in all except the smallest size, and the ratio of heat generated above and below the bath can be regulated over a wide range.

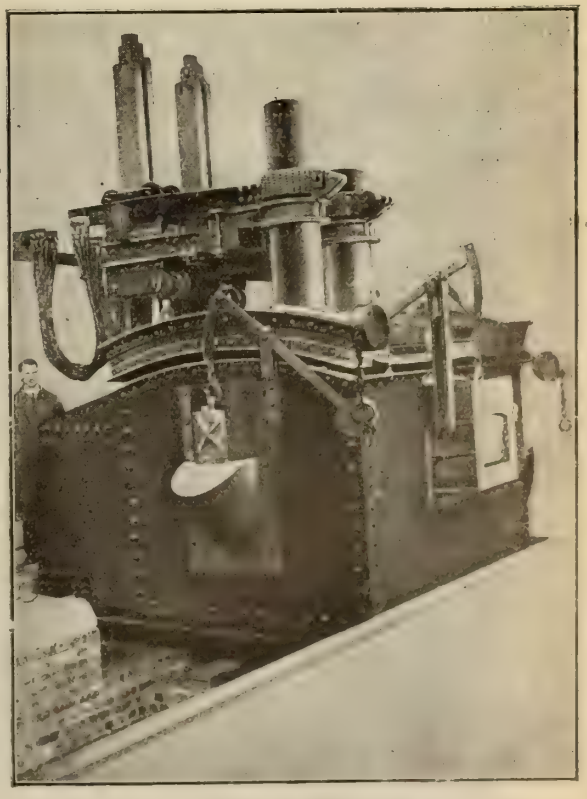
Power Factor and Load Curve

The power factor is high, owing to the elimination of unnecessary reactance. The operating power factor obtained in one plant as a result of over twelve months' running averaged during the melting down period between 85 and 88 per cent., and 92 to 95 per cent. was consistently maintained during refining.

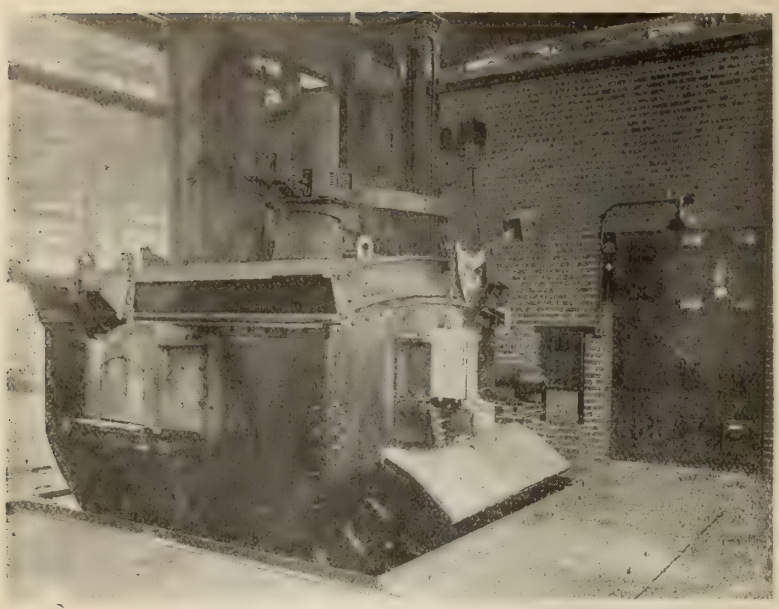
The remarkably even character of the load is well illustrated in the accompanying chart, which was taken on a 6-ton Greaves-Etchells furnace after a shut-down of 18 hours, using cold miscellaneous scrap and refining under two slags.

Mechanical Features

The furnace is of substantial con-



TYPE OF FURNACE.



THREE-TON GREAVES-ETCHELLS FURNACE.

struction and the design is such that ruggedness combined with strength is achieved. Furnaces up to 6,000 lbs. capacity are mounted on rockers operated from the rear of the furnace. The tilting arrangement is so designed that the centre of gravity falls just below the centre of radius of the rockers in any position, making a perfectly safe and well-balanced arrangement, with minimum wear-and-tear on the tilting motor and gearing. The tilting system is provided with limit switches, which give perfect safety in operation. All electrode arms are also provided with limit switches, preventing accidents when in the hands of careless operators.

On the larger furnaces there is a special roof-lifting feature, which takes away entirely the strain on the bricks of a new roof when being put into place.

Operating Characteristics

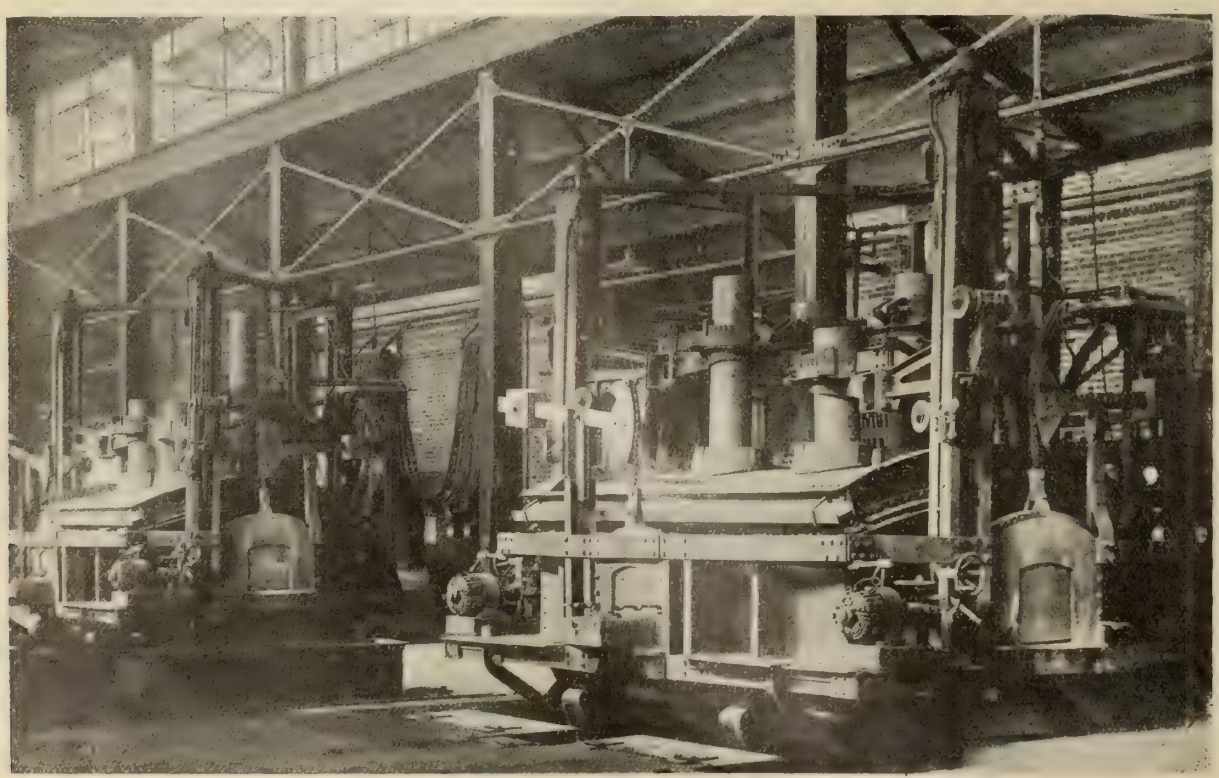
In the electric furnace, steel of any composition made by other processes can be duplicated, and the process lends itself further to the manufacture of steels which would be impossible of manufacture by older methods. Illustrating this point, it is perhaps only necessary to point out that practically all low-carbon steel containing anything from 7 per cent. to 14 per cent. of chrome—generally known as "Rustless Steel" is made in the electric furnace, using low grade high carbon, ferro-chrome and common steel scrap—the elements carbon, sulphur and phosphorus being satisfactorily eliminated.

The electric furnace process is essentially a basic one and the same reactions resulting in the oxidation and removal of phosphorus which are carried out in the basic open-hearth process can be applied in the first stage of melting a charge of common steel scrap in the electric furnace. The electrical process goes further, however. After removing the phosphate slag, another slag can be made up with lime, sand, and fluorspar, which, by closing up the furnace doors and spreading finely powdered coal on the slag, can be worked under reducing conditions. This results in the rapid removal of sulphur and in the reduction of silicon from the slag into the steel. The reduction of silicon can be carried to any desired extent and results in killing or deoxidizing of the steel.

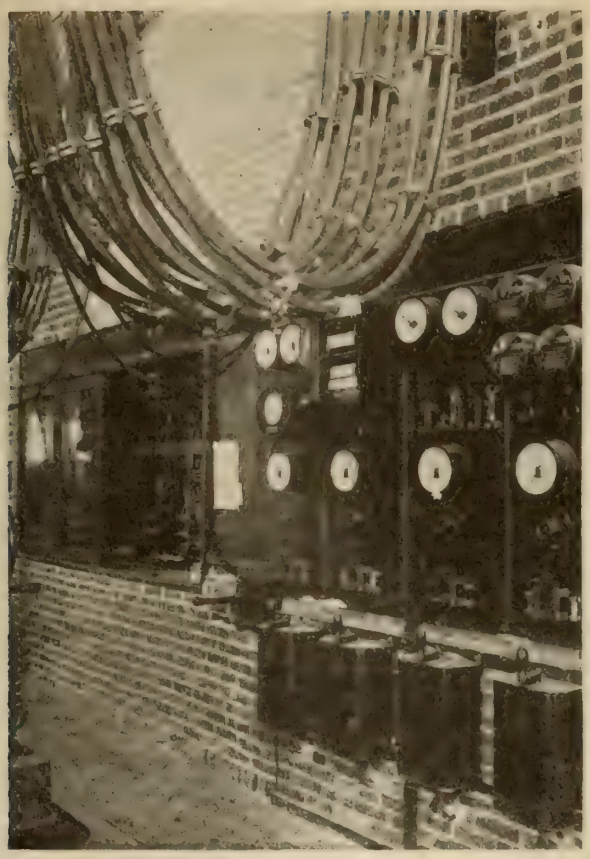
The electric furnace finishing slags are peculiarly light and non-cohesive in nature. The slag rises very quickly to the surface of the steel, and when the steel is teemed into ingots it is consequently free from slag fibre. This property has proved of enormous value, especially in the case of steels, which have to withstand sudden shocks and stresses, such as the driving parts of motors and various bullet-proof steel plates.

The making of steel in the electric furnace may be divided into two periods, the melting or breaking down period and the refining period. Anything which is of advantage in shortening the time taken for these periods manifestly effects a considerable economy in power and results in increased output.

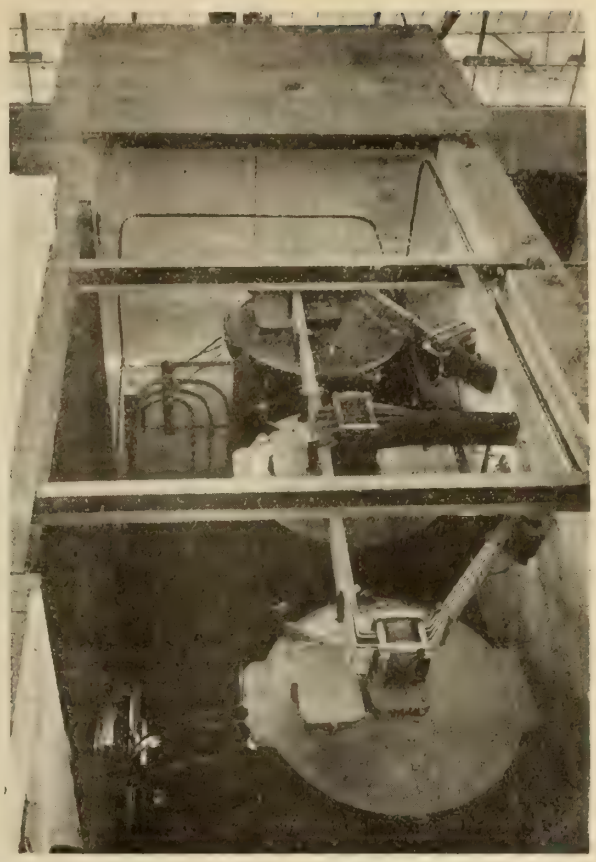
Since the current in the furnace under



TWO 6-TON FURNACES. ONE OF THEM IS IN OPERATION. WHICH?



TYPICAL VIEW OF FURNACE CATENARIES AND CONTROL.



GREAVES-ETCHELLS FURNACE. ARRANGEMENT OF LOW TENSION COPPER.

consideration flows through the metal and hearth, considerable heat is generated in both metal and hearth, as well as in the arcs immediately above. This results in an extremely short melting period. The refining period is also shortened since the slow circulation of the molten metal set up by bottom heating, carries all portions of the bath to top and effects an intimate contact of refining slags with every portion of the metal.

On basic linings, 3-ton furnaces equipped with 900 kv-a. transformer capacity are melting three tons of metal in one hour, forty minutes, and completing the melting and refining of a charge in two and one-half hours. Six-ton furnaces are melting in two and one-half hours and completing the heats in under four hours per charge. On acid lining furnaces these figures have been considerably improved.

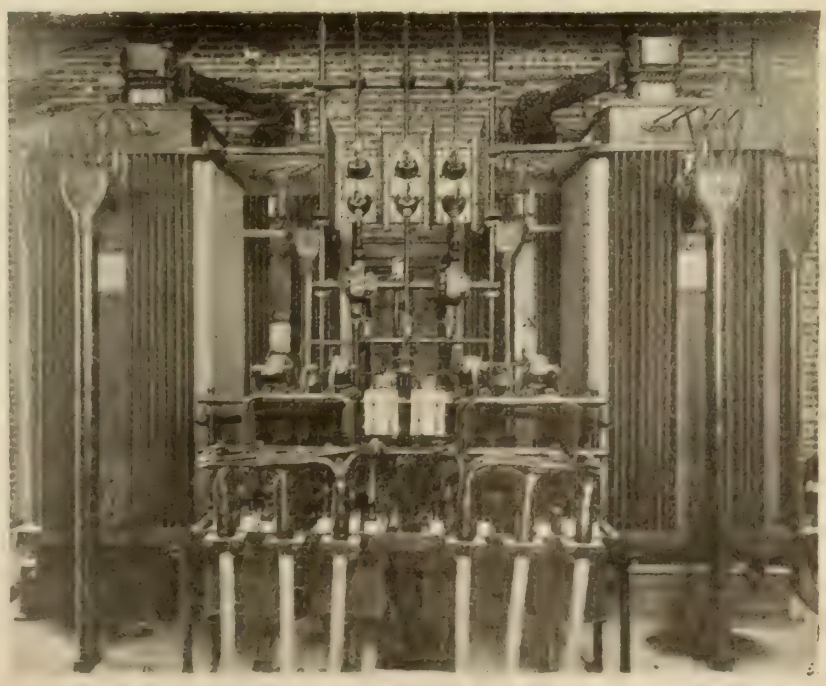
Electrode Consumption and Refractory Life

Conditions under which electric furnaces operate are usually of such a varying nature and the various metallurgical operations carried on in them are so different that it is almost impossible to make any accurate generalization as to the electrode consumption or refractory life.

It might be expected, however, that the operating features of the furnace now under consideration would lend themselves to economy. This is evident when it is considered that the hearth is used not only for the return of the current, but also for heating. Less heat is therefore generated above the bath and less carbon or graphite is consumed from the electrodes.

One user reports a life of 125 heats for roof, walls and bottom; these figures are from time of installation and it was estimated that the roof would last for 25 heats more before repairs would be necessary. Considerable refining was carried out in this instance.

Another furnace of one-half ton size has run for 15 months without repairs of any kind to the lining. During this time 220 heats were run off. This furnace and another of a somewhat similar record was used in the making of nickel-chrome airplane steels of intricate composition. The molten steel had to be held for refining and the proper



TRANSFORMER CONNECTIONS, 6-TON FURNACE, GREAVES-ETCHELLS SYSTEM.

adjustment of carbon, silicon, manganese, chromium and nickel contents.

Two-ton furnaces have consistently given 120 to 130 heats before repairs to the roof were necessary.

The furnace hearths, if properly cared for, seem to last indefinitely, one furnace having made over 3,000 heats on the one hearth.

Electrode consumption varies, of course, with the kind of steel made and with the duration of refining operations. The size of the furnace has also considerable to do with the consumption. By the use of economizers figures of from 9.1 lb. to 11 lb. of graphite per ton of steel are generally obtained.

Properties of Electric Steel

It has been mentioned that electric steel, aside from the properties conferred on it by alloying materials is possessed of marked physical characteristics which render it superior to steels made by other processes. That this is so may be seen from the results of tests made by one firm on the product of their Greaves-Etchells furnace:

	Steel A	Steel H
Yield point long tons	23.78	67.33
Maximum stress long tons	37.44	73.10
Elongation per cent.	32.0	21.50
Reduction of area	47.0	43.76
Brinell hardness No	156.0	
Stanton Impact Fig.	1560.	10200

Steel A was a mild steel with about a carbon of .15 per cent. and the test shows remarkable results.

Steel H was a nickel chrome hardening steel and the elongation is very satisfactory. The makers further stated that the Stanton Impact figure obtained was the highest obtained in their own laboratory.

Greaves-Etchells furnaces are made in ½, 1, 2, 3, 5, 6, 10, 15, 30 ton sizes by the Electric Furnace Construction Co., Finance Building, Philadelphia, and T. H. Watson and Co., Limited, Sheffield, England.

The method of obtaining a balanced primary from either a two or three-phase electrical supply and the method of generating heat in the hearth of the furnace are protected by patents.

At last the corn cob has come to its own. The cob has been relegated to the scrap heap for a great many years as a worthless appendage after it had served its primal purpose. It is true that pipes of peace have been made out of it, but now comes the Department of Agriculture and is ready to utilize it, for it has been found that 35 per cent. of it is transformable into crystalline glucose which has many uses, one of them being the production of alcohol. Another use is adhesive which is used in making fibre boards and paper boxes. This adhesive could be made colorless and would replace the starch, dextrine, flour paste, and only 3 per cent. of the cobs would have to be used to replace all this.

MAKING WOOD MACHINE HANDLES

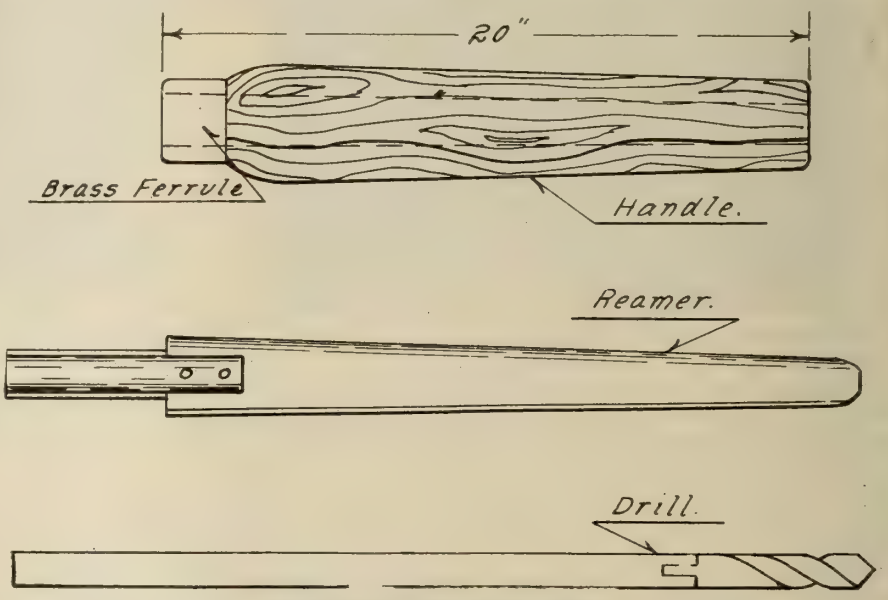
By Donald A. Hampson

We were getting out a line of machines that required a cherry handle of the general shape shown by Fig. 1. The inside had to fit a tapered steel core—the outside was turned to a shape that was pleasing to the eye and comfortable for the hands. We thought any of the wood-working shops in town could make the handles for us, and gave them little thought until almost ready to use them. Then we found nobody cared to undertake the job. In desperation, we asked, "Tell us how you would make them, and we'll try it ourselves." The reply was, "We wouldn't make them." Nothing to do then but apply machine shop methods—all we knew—to the wood-working business and try our luck.

Getting the blocks in squared lengths, they were set up under the drill press and the holes step-drilled, just as is done in roughing out taper holes in steel before using a finishing taper reamer. Our finishing reamer was shop made of a piece of ⅝-inch by 2-inch machine steel planed to right taper and set into a shank. With the shank in the drill press chuck, the taper "bore" was finished very quickly by running the reamer down. The surface was not altogether smooth (round), but it was straight from end to end, which was more important than the absence of chatter marks.

In doing the rough drilling the twist drills gave out at a depth of eleven inches. To reach the remaining distance, pieces of broken 13-16-inch and 1-inch drills were rescued from the scrap pile, softened, and ⅝-inch rods spliced on. These drills did very nicely for the work in wood. As an experiment, holes were drilled with carpenters' bits, but it was shown that they followed the grain of the wood much more than the twist drills, which fault produced crooked holes that did not clear up.

After the bore was finished, a section was turned a driving fit for ferrules of brass. And finally the contour was turned, using a long taper arbor on which the handles were "driven" by a thrust of the hand.



THE HANDLE AND TOOLS USED.

The manager of the Queensland State iron and steel industry enterprise is recommending the Government to establish blast-furnaces and coke ovens for start with a view to turning out pig iron and coke and other by-products, the proceeds of which would assist in financing the larger industry. He estimates a consumption of about 1,000 tons of coal a day and about 500 tons of mixed iron ore from Cloncurry (Mount Leviathan and the Biggerden deposits. It would take about two years to establish the scheme for blast furnaces, etc., and another year and a half to complete the whole scheme.

Dealers in, as well as original sellers of, iron and steel scrap from explosive plants are warned by the Bureau of Explosives, New York, in a special bulletin, to guard against explosions caused by guncotton, picric acid, or T.N.T. inside of pipes or receptacles. The following are instances of such accidents: Damage to a metal plant in the melting down of lead pipe containing picric acid, explosion in a storage yard because of contact of a lighted match with nitrocellulose, the severing of a hand from an explosion resulting from the crushing of pipe between two hammers, killing of employees cutting up pipe from the oil fields of Oklahoma, in which a detonating cartridge had been left. One explosive company makes a double inspection of all pipe leaving its plants; it is first burned in a woodpile and then inspected, each piece being marked with red paint; after it is loaded on cars another inspection is made, markings with blue paint indicating it.

In order to make Switzerland less dependent on imports, the Schmidt-Roost Oerlikon Company have established a steel foundry, where scrap iron is converted into steel in electric furnaces.

The Use of Gauges in the Mechanical Field

A Paper on the Origin of Gauges With Various Systems Used. Allowances and Tolerances. Old Method of Go Gauges and Screw Thread Work

By E. C. PECK
Lieutenant-Colonel P. S. & T. Division, Standardization Section

IT IS a well-known fact that gauges of some description have been used since men first began to contrive conveniences for himself. The standards of weight, measure and volume mentioned in the Bible are gauges. The instruments and appliances used in building the pyramids were gauges. In fact it has been apparent from the beginning of time that standards for determining dimensions, capacity, quantity, force, etc., are not only necessary, but aid materially in conducting all kinds of commerce and business.

In bargaining for a quantity of material it is necessary to have a standard unit acceptable to both buyer and seller to determine whether the quantity bargained for is understood by both, and the bargain carried out.

Tribes, states and countries used gauges originating with themselves, and probably the tribe or state doing the most trading with the neighboring countries succeeded in establishing their standards in other countries, and hence the most used gauges were handed down to us. It certainly would have been much better for the present generation if there had been little more co-operation among the ancients in regard to standardization, then we would not have the heterogeneous collection of gauges or units that we are all familiar with.

It must be evident to everyone that all business and commerce would be conducted with less expense for the service rendered if standard specifications were in use and had the same meaning all over the world. It would seem like a logical statement to say that some one system of standards ought to be enough better to win over the entire world by its greater utility, but this has not proved to be true. The two systems which most concern this country are the English and metric. Both are used extensively, both are legal and each has its advocates. It seems obvious that the outstanding advantages of the metric system have not been sufficient to supplant the English in this country. To me the outstanding advantage of the metric system is that all subdivisions are multiples of 10, and hence in calculations it is only necessary to move the decimal point in the reduction from unit to unit. Great advantage is also claimed in that the units of weight and volume are derived from the unit of measure, but to me this is of little account. For accurate work one does not want to originate his own standards, but prefers to obtain them from the Bureau of Standards, which can compare a standard without regard to its origin.

One advantage claimed for the English system is that most subdivisions are made by successively halving each unit. If these arguments are adhered to by the advocates of each side, they both fail, because their methods result in units the size of which are impracticable, based on experience.

In the English system, beginning with the inch and halving of each subdivision, we finally reach the units: 1-64, 1-128, 1-256, 1-512 and 1-1024—all of which are awkward to handle and not readable on the well-known micrometer without estimating. To obviate this difficulty, the inch is divided into tenths, hundredths, thousandths and ten-thousandths, and all of these decimal units are practicable and usable units.

In the metric system, the first subdivision of the meter is the decimeter, a unit 3.973 in., of no utility and rarely used. The next unit is the centimeter, a unit too large for good work and too small for use in distance measurements. The next is the millimeter, 0.03937 in., the most widely-used unit because of the adaptability of its size value. Many industrial enterprises require no greater accuracy than a millimeter, and therefore, as this unit is about as fine as can be used on a steel scale, it is sufficient for their needs.

For tools and fine accurate mechanisms, the millimeter is too large, and so is the next subdivision, 1-10 millimeter, which is 0.0039. The great bulk of good work in our machine-tool, automobile and the tool-making industries require units between 1-10 and the 1-100 millimeter, as one is too coarse and the other too fine.

The result of this is the halving and quartering of the millimeter and the 1-10 millimeter to get the usable units approximating 1-100, 1-1000 and 2-1000 of an inch. Thus it will be seen that the advocates of both systems use what the other claims as an inherent fundamental of his system.

If when the meter was adopted all romance and sentiment had been left out of the question, and the meter made 10 English inches, the metric system would have been in universal use long ago. The theoretical value of the meter is on a ten-millionth part of the distance from the Equator to the pole, and after this figure was established an error was found in the calculation, so that now we haven't even this sentimental advantage.

If the meter had been 10 inches, metric threads could have been expressed in whole numbers per decimeter, and this would agree with present practice, and would fit in with the United States system.

The First Interchangeable Manufacture

The first interchangeable manufacture attempted was in France in the year 1717, and it failed. Another trial was made in 1785, which also failed. In 1798, Eli Whitney, of cotton-gin fame, took and completed a contract to make ten thousand muskets for the United States Government, and the parts of these guns were interchangeable.

English and French ordnance officers ridiculed and criticized Whitney's ideas to such an extent that Congress became alarmed at the money being used for the purpose. Whitney went to Washington with ten guns and distributed the parts on the floor, assembling repeatedly ten guns from these parts, that operated properly. This remarkable achievement astonished everyone, and it is believed to be the first successful interchangeable manufacture of accurate work. As nearly as can be found out from the records available, this occurred in 1800. In 1808, Simeon North accomplished a like feat on pistols for the Government.

It is also known that John George Bodner began to manufacture guns at St. Blaise in the Black Forest about 1806 by a new method, which is believed to have been partly interchangeable; that is, some of the parts like the lock and stock were made and carried in stock. Interchangeable manufacture is conceded to be an American development, and is described by writers on the continent as an American method. In 1853 a British commission visited the United States to investigate the methods in use, and as a result ordered 20,000 Enfield rifles for the British Government, and later 157 machines for the Government arsenals, and hired James H. Burton to install the machinery and methods.

From this small beginning the practice grew steadily in the armories and arsenals, and later as the advantages became known, it spread to bicycles, typewriters, and various other things, until now it is quite common to speak of interchangeable manufacture. There is no doubt but there is some difference between the exact meaning of the term then and now, just as there is a great difference between manufacture then and now.

There are several degrees of interchangeability, or at least several meanings to the exact interpretation of the term. Strict interchangeability consists in making the different parts of a mechanism so uniform in size and contour that each part will fit and properly function in any one of the whole number of mechanisms, no matter when or where it is made.

In the early days before modern machinery came into use, it was necessary to finish work by hand, and to make it uniform, template filing and finishing were resorted to. For example, gun and

pistol parts would have the holes drilled and reamed in a jig or fixture, and then the contour finishing was done by putting these pieces into a template jig provided with pins to fit the holes. The outside of the jigs would be a duplicate of the shape and size of the model piece and hardened. The workman would then file down to the hardened template, which controlled the shape and size of the piece. Many ingenious devices and schemes were used to facilitate the duplication of parts, and great skill was developed in the workmen.

The great improvement in machine tools, especially as to accuracy of output, was a very great factor in promoting interchangeability, and here again, America had led the world. The refinements, accuracy and efficiency of modern machine tools are strictly American.

American labor costs so much more than foreign that to compete in the world markets, we had to obtain as much product for each dollar of labor as our competitors, therefore, we had to develop machinery to get more product for less labor. This in turn has developed skill in our mechanics, and raised the standard of living so that to-day American skilled workmen are the best paid in the world.

It is a fundamental law that interchangeable manufacture is facilitated by the largest allowable freedom in the fit of mating parts without interfering with the proper functioning.

Allowances and Tolerances

This leads up to the subject of allowances and tolerances, one of the simplest, but least understood in the whole system of interchangeability. As these two words will be used repeatedly, it is well to point out the difference between them.

Allowance is a prescribed difference between the dimensions of two mating parts to produce a desired kind of fit. Example: A standard hole exactly 1 in. in diameter, with a free running shaft, the journal diameter of which is 0.998 in. The difference between this hole and the journal prescribed for the oil is 0.002 in. and this is the allowance.

Tolerance is the prescribed difference in the dimensions to tolerate the unavoidable errors or variations in manufacturing a large number of pieces.

In the above example, if a thousand running fits were to be made, the holes might be dimensioned 1.000 in.

$$+0.005$$
$$-0.0000$$

This half thousandth permissible error is the tolerance.

The shaft journal might be dimensioned 0.997 to 0.998 in. and this permissible error of 0.001 in. is the tolerance. Then the minimum allowance is 0.002 in. and the maximum looseness or the sum of both tolerance and the minimum allowance is 0.0035 inch.

Thus the kind of fit is finally determined by the combination of the allowance and tolerance, and most engineers prefer to use allowance as a minimum value, which is never intentionally encroached upon, the tolerance providing for larger freedom of fits. The reason for this is that the data for minimum allowance is more reliable and has been more clearly demonstrated than the maximum allowance, and as it is vital, it must be unaffected by tolerances. This is plainly evident in the case of free moving parts, as it is well understood that a space must be provided for an oil film, and this space must not be so small as to endanger failure by the parts seizing.

There are many conditions in which maximum looseness determines the strength of the parts or the limits of engagement, and any more freedom of fit would make the parts unsatisfactory. When this is the case, maximum looseness must be the starting point in the calculations, and this must then be unaffected by tolerance. Then if minimum allowance can be determined, the difference between these two, maximum and minimum looseness, will be the sum of the tolerances.

The tolerances are then divided between the mating parts according to the manufacturing ability to produce the parts to uniform size. That is, if the manufacturing ability is such that it is much easier to produce uniform size to one member than the other, the tolerance on the members is divided in direct proportion to this condition.

Very often the allowance has zero value; that is, there is no clearance whatever allowed for the fit, and in a single pair of mating parts, they fit metal to metal. Now if a large number of such parts are to be made, it must be determined whether this zero allowance is for the tightest or the loosest fit permissible.

The term "negative allowance" is often used to indicate that we allow a certain prescribed amount to make a tight or force fit, and is very confusing because it implies being subtracted, and this is not the case. According to present usage, zero allowance indicates that there is no clearance or space allowed between the two mating parts. Positive allowance indicates that there is prescribed a space between the mating parts. Negative allowance indicates that there is less than a space provided for between the mating parts, or an imaginary space displaced by the flow of the metal to make a tight fit.

The minimum allowance or greatest tightness and maximum looseness must be known when the tolerances have been set, and usually they are known at the time tolerances are set. There are, however, cases in which it is known that certain tolerances are the smallest that can be successfully used in manufacture, and then maximum looseness and maximum tightness must be adjusted to obtain the best functioning condition in conjunction with these tolerances.

After determining the maximum and minimum looseness of mating parts and setting the tolerances, it becomes necessary to control the dimensions of the parts so that none of the dimensions will be outside of the limits established, and that is best done at this time, for strictly interchangeable manufacture by the use of proper "go" and "no-go" gauges. First-class gauges are expensive, and soon wear, so that strict interchangeability is sacrificed to keep down gauge cost.

Old Method of Using "Go" Gages

In times past it was common practice to use "go" gauges only, and limit the looseness of fit by the shake of the piece in the gauge, or where a little more refinement was practised, a piece of newspaper was used on one side of the "go" gauge, and if the piece which passed without the paper, was tight with the paper, it was accepted. A piece of newspaper used with each of a pair of mating "go" gauges usually produced a freedom of fit from 0.004 to 0.006 in., and with skilled help, it produced satisfactory results.

For strictly interchangeable quantity-production work of good character, a good gauging system will prove economical. Such a system comprises the minimum number of properly designed gauges to control all the factors of the various parts of a mechanism, so that they will assemble and function properly. This assumes that proper allowances and tolerances have been established.

The designer should always keep before him the fundamental that tolerances should be as large as proper functioning will permit, and he should be well informed what tolerances successful manufacturers actually work to. He should take pains to learn how tight and how loose working parts can actually be, and give satisfactory results.

Once these tolerances are set as large as the designer will risk, they should be rigidly adhered to, and considered a boundary line. The product should always be kept within these boundary lines, and this is best accomplished by making the component drawing dimensions the master-gauge dimensions. Then with all the working and inspection gauges checked against master gauge, and never allowed to wear beyond master-gauge dimensions, the work is bound to be within component dimensions.

An exact duplicate master gauges cannot be made expect at a prohibitive cost, a master-gauge manufacturing tolerance is allowed. This tolerance is usually in good practice from 4 to 6 per cent. of the component tolerance, and is applied in the direction to keep the work within the boundary line defined by component dimensions. This gauge tolerance is treated as a wear limit, and robs the working tolerances by this 4 or 5 per cent.

Inspection gauges are usually of the same design as the working gauges, and after the same as the master gauges, but should have an additional allowance for wear. Inasmuch as the gauges will wear, and as they are expensive, the exact amount to allow for wear is an economic point for each manufacturer to decide, keeping in mind that a small wear limit increases gauge cost, and a large wear limit requires closer attention and work at the machines.

Where experience is lacking, it is good practice to allow 10 per cent. of the com-

ponent tolerance for wear on the "go" gauges; as the "no-go" gauges wear but little, 5 per cent. will be sufficient. The inspection gauge can only represent extreme tolerance limits when worn to master gauge size. The working gauges are those used to check the work as it is machined, and should have liberal wear limits to insure the work being passed by the inspection gages.

Thus is will be seen that this system, if foliowed, wil admit of the acceptance of work that will be interchangeable. It also emphasizes the fundamental that tolerance should be as large as will properly function.

If the tolerances are too small the work will be more costly, because better workmen wil be required, and this always means higher wages. Better tools and machines to produce the close work and more frequent adjustment and attention is also necessary as well as additional gauge cost. Close tolerances cause large rejections of the work, and more or less friction between the inspector and those responsible for the work.

Screw-Thread Work

The examples and descriptions so far have applied to all kinds of interchangeable work with no particular reference to screw-thread work, and while the principles and practice are the same, a great deal more care is required to produce strictly interchangeable screw-thread work than plain work. The problem becomes more difficult because a larger number of factors make up a proper screwthread fit, and a big error in any one of the factors, will prevent a proper fit. A comparison of these factors may help to make the solution more comprehensible. A cylindrical fit depends upon the size, rotundity and parallelism of the mating parts. Rectanguiar sliding fits depend upon size, contour, and parallelism of the mating parts. Of course, they all depend upon size, but in a screw-thread fit, size is affected by the errors of the lead in the mating parts, and the errors in the angle of the thread. Thus the factor contour in a screw thread is made up of the factors of lead and form of thread.

Two mating parts with correct lead require no compensation in size for the lead factor. Two mating parts with an equal lead error in the same direction, either long or short, require no compensation in size for the lead error. Two mating parts with different lead errors or the equivalent, require a compensation in size for this lead difference to enable the mating parts to go together.

Two mating parts in which the contour of the thread is affected by an error in the angle of the flanks of the thread, must also have a compensation in the diameter to offset the angle error, or the metal must flow to make the fit. Thus it will be seen that strictly interchangeable screw-thread product is more difficult to produce, and if good fits are required, close tolerances and good thread-producing tools are necessary. There must be a rigid inspection and means of controlling all factors which make a fit.

Where gauges are used, as at present time, they must be periodically checked against master gauges in order that boundary lines are not encroached upon. It is fundamental that the "go" gauges should check all factors simultaneously, and the "no-go" gauges should check factors separately. Thus it must be obvious when it is remembered that lead and form are compensated for by increasing the diameter, and hence to be sure of the correct relation of all the factors to each other, they must be gauged at once and with a gauge as long as the engagement of the mating parts. The exception to this is the minor diameter of the nut, and the major diameter of the screw. To include these two dimension factors in the "go" gauges, would make cost of the gauges prohibitive, and as these surfaces in the mating parts are intended to be cleared when assembled, it is practicable to get gauge them separately.

Some idea as to the cost of iron castings in America at the beginning of last century may be gained from some extracts from the minutes of the Albany Waterworks Company—published in the "Engineering News Record." On May 1, 1813, the trustees of the company opened the following tenders for cast iron conduits: (1) From Thomas Trenor, of Bennington, 128 dols. per ton, of 3 ft. length; (2) Eliphalet Sturtevant, New York, 140 dols. per ton, of 3 ft. length, or 120 dols. for 2 ft.; (3) Holly and Hoifing, of Salisbury. Conn., $100 per ton, "in joints of one length of 2 ft. each." The contract was awarded the same day to the last-named and lowest bidder, but with the proviso that the bidder supply 200 joints, "carefully cast, as a fair sample of the work, agreeably to a description laid down on paper by the superintendent and enclosed to them (the bidder) in order that a fair experiment may be made of the strength of the pipes according to the proposed dimensions, and that this Board will be ready to enter into a contract on the subject at any day when the parties will attend." Apparently the low bidder gave satisfaction, for on October 4, 1813, the trustees resolved to contract with Holly and Hoffing for 150 to 170 tons additional of cast iron conduit delivered on the dock in Hudson by November 1, 1814, at 100 dols. a ton.

A GLUE JOINT TEST

Glue joints between wood surfaces which have been coated with shellac or varnish have low or very erratic strength. This has been thoroughly demonstrated by a recent test at Forest Products Laboratory, Madison, Wis., U.S.A. Sixty pairs of test blocks were prepared in which one or both wood surfaces were varnished or shellacked, and were joined with either casein or animal glue. A great many of these blocks fell apart before testing, and all which held together long enough to be tested sheared apart in the glue joint and not in the wood. The highest strength value obtained was 1,712 lb. per square inch, which is low for casein glue. The other values were 1,000 lb. per square inch or less. It is evident, therefore, that all shellac or varnish should be carefully cleaned from wood which is to be glued, if high strength is desired. A few blocks were joined using shellac as a glue over surfaces previously coated with shellac. The maximum shear strength obtained was 1,425 lb., the minimum 450 lb., and the average 758 lb. per square inch. These values are low, and do not indicate that shellac has gluing properties which compare favorably with casein or animal glue.

THE AIRPLANE AS A PACKHORSE

The feasibility of transporting machinery and supplies by airplane to the numerous gold and silver mines in the States of Sinaloa, Mexico, is to be investigated by the British Government, according to an article in a recent issue of "Commerce Reports." According to the story, it appears that a British company is prepared to organize and operate an air service between the mines and railway stations for the transportation of machinery and supplies to the mines, which, due to their mountainous location and the absence of roads, at present are practically isolated. At present it is practically impossible to transport heavy machinery tc these mines, and the only machinery which can be transported must oe carried on the backs of burros, whose maximum limit of carrying is about 300 pounds each. It is understood that it would be the purpose of the proposed company to transport machinery weighing several tons.

RECENT INVENTION

A recent British invention has been made whereby the piston of an internal-combustion engine may be cooled by means of a draft of air circulating through a space in the piston. The draft is provided by means of fan blades on the engine flywheel. On either side of the hollow piston are ports which register with corresponding ports in the cylinder walls at the end of the stroke. A draft of air is thus forced through the hollow space in the piston while all the ports are in line.

Certain French financiers are contemplating the establishment of a large institution in Paris, with a view to centralizing trade. The building would contain samples of all the products of the world, classed in groups. Each storey would contain galleries for the sale of all kinds of imports and exports, together with a special staff who would supply information with regard to specialized branches of all trades. There would be information bureaus with interpreters, stenographers, etc., attached, and electric power to work the exhibits.

Canadian Machinery Drafting Course Part VIII

This is the Last Plate in Projection. Study the Principles Carefully, for it is the Underlying Principles That Count. Once You Realize WHY You Do Certain Things, the Rest is Easy

By J. H. MOORE, Associate Editor, Canadian Machinery

BEFORE going into this eighth portion of the course, let us discuss a very important matter, relative to the course and its procedure. As the writer explained when commencing this series of studies, it would be impossible to go very deeply into the various subjects and classifications, without taking up too much of the students' time, and perchance making the course very long and tedious.

For this reason we believe it would be good policy to outline, as it were, what is ahead of the student, to show him that we are keeping in mind the fact that it is not our intention to keep him longer than is absolutely necessary on the theory of drawing and its various underlying principles.

Starting with this portion, which is the last in projection, we will take up one plate on conic sections, one plate on intersections, together with developments, after which we will branch directly into mechanical drawing, so, as readers and students can see, it will not be long before they enter the strictly mechanical field.

After entering the actual drawing of portions of machines, etc., the student will take on an added interest. The writer speaks from personal experience, for he has passed through the mill and knows how it goes. He remembers well that he used to remark when studying all the elementary principles, "But what's all this got to do with mechanical drawing?" He later found out, however, that his time was well spent. His course of study, incidentally speaking, was a long (and to be honest) a tiresome one, stretching over four years, not covering ground as we are attempting to do here in this series of lessons.

Now that we have shown students just what our plans are for this work, let us get on to the present lesson.

Students will easily remember the last plate which illustrated various problems in projection, first showing the sketch, and later the mechanical drawing, or projected view. No doubt the principles underlying the subject were thoroughly mastered, at least we will assume so, and go on to four further problems of an entirely different nature.

The objects on the last plate were all made or drawn under the supposition that either the centre lines, or at least one flat side, was parallel to the plane of the paper. The centre lines of each object were also either vertical or horizontal.

Such conditions are always possible when making detail drawings, where each piece is drawn separately by itself, but in the case of machines, especially intricate machines, where the parts are drawn at different angles, they cannot always be drawn in this manner, which naturally makes it a little more difficult.

The objects shown on this plate are not so difficult in themselves to draw, but they are placed at different angles to illustrate and educate the student into this new condition of projection.

Particular care should be taken to study and understand this plate, in fact, all plates, to follow between this and the actual mechanical drawing, for if the student thoroughly masters the principles of this plate, and those to follow, he will experience no difficulty later on in the course.

To commence with plate No. 8, let us look at Fig. 1.

Here we see a rectangular prism at A, which is 1½ in. long, 1¼ in. width, and ⅝ in. thick.

The problem now consists of constructing this prism, standing in a perpendicular position on one of its small ends, in such a manner that the broad sides form an angle of 30 degrees with the horizontal line.

Of course, the plan in this must be drawn first. To do this, draw the rectangle 1, 2, 3, 4, with the sides 1, 2, and 3, 4, forming 30 degrees with the horizontal. This may be easily done, by means of tee square and 60-30 degree triangle, which readers are, no doubt, well familiar with.

To construct the front elevation, draw a horizontal line, 11, 14, and project down the point 1 upon this horizontal line, thus obtaining the point 11. Now draw 11, 18, 1½ in. in length, namely, the length of the prism. Next, draw the horizontal line 18, 15. Continue to project down the points 2, 3, and 4, from the plan on to the elevation, making the points of intersection at 12, 13, 14, 15, 16, 17, respectively. The line 12, 17 is dotted, because, as is plain to be seen, this point is a projection of the corner 4 in the plan view, which would be hidden in the elevation.

The side elevation is now a simple matter. Project lines 11, 14, and 18, 15, until they reach 22 and 23 respectively. Produce a line from point 2 in the plan till it reaches the point 29; also produce a line from 1 in the plan until it reaches the point 27. Produce another line from point 4 till it reaches point 28, as shown. Now proceed further with your side elevation.

Take your dividers and measure the distance from point 29 to 3. Come down to the side elevation, and lay this distance off as shown at 19 to 20. Next, take distance 29, 27, on plan, bring it down in similar manner, which now is 19 to 21. Last, but not least, take the distance 29, 28, on the plan and mark it off on the elevation, which is, of

What is the Purpose of Our Drawing Course?

A SHORT time ago CANADIAN MACHINERY received a letter from Mr. A. M. Lount, master mechanic of the Massey-Harris Co., Toronto, regarding our course of studies.

To receive a letter from a busy man such as Mr. Lount is proof to us that our efforts are appreciated. He spoke as follows:—

"In comment of your course, would say that the writer has found several of his men who are following this course, and is very pleased with the idea, but would suggest that you call attention strongly to the point that a course of this nature is particularly valuable to the man on the machine, or the bench, just as much as it is to the beginner in the drawing office.

"With reference to the course itself, would say that so far it appears to have been very cleverly designed and is just about the thing that is needed."

WE appreciate Mr. Lount's interest, and can only emphasize what he has already stated, namely, that the man on the bench can make good use of these lessons.

He will become more adept at his daily task, prove of more value to his firm, which, in turn, will prove a means of increasing his salary.

All are welcome, no matter what position they hold. Our only means of knowing how our work is taking root is to hear from you. Let us have both your opinion and your suggestions.

We have an important announcement to make in our Dec. 18th issue relative to this course. Watch for it.

course, 19 to 22. Now construct your side elevation complete, remembering to make the line 21, 24 dotted, because point 1 would be hidden in a side view, such as we have just projected.

Moving to Fig. 2 we also find a rectangle of similar size, but in a different position.

Here the prism is shown with the narrow sides parallel to the plane of the paper, but the object is now tipped until the base makes an angle of 15 degrees with the horizontal.

The procedure is very similar in this case. We start from the titled elevation view, and from this project the side elevation and the plan. Briefly, you project points A, B, C and D as before, these terminating at M, N, O, P, Q, R, S and T, the distance M T being 1½ in. The side elevation is projected as follows: Produce points A, B, C, D till they reach F, H, J and L. The line E F equals M T or 1½ in., the length of the prism. The reason for the lines N S and R H being dotted is self-apparent, they being hidden lines in their respective views.

Fig. 3 is next in order, and represents a hexagonal prism 1½ in. long, 1 in. across the flats. The student is expected to draw at the space B, how such a prism would appear to the eye, just the same as we showed at A, in Fig. 1, how the rectangular prism appeared to the vision.

Starting from the plan view we construct the hexagon 1, 2, 3, 4, 5, 6, in either of the following manners:

Draw a circle 1 in. in diam. and draw both centre lines, projecting the vertical one down to be used in the elevation view. As there are 360 degrees to a circle we can easily see that 6 (the number of sides to the polygon) divided into 360 equals 60 or 60 degrees. You can therefore divide your circle up into sections of 60 degrees, joining with lines tangent to the circle at these points, which, of course, will make your hexagon.

A much easier method, however, and one you will use later on in the course, is as follows: Draw your circle 1 in. diam. as before; then draw your centre lines, and with your 60 degree triangle and T square you can easily accomplish the rest. Run your triangle along the T square until it is tangent with the circle, and draw your lines. This constructs the lines 2, 3, and 5, and 6, 1, 2, and 4, 5. Now draw parallel lines 1, 6, and 3, 4, when your hexagon is complete. The front elevation is a simple matter. Merely project down your points 2, 3, 4, and 5, till they reach the line, 7, 10, which you draw in whatever position to suit your convenience. Next, lay out the line 7, 14, 1½ in. long, and produce this horizontally till it reaches point 11, after which complete the front elevation, 7, 8, 9, 10, 11, 12, 13 and 14. The next step should be watched carefully, for we desire a side elevation as if the vertical prism were looked at in the direction of the arrow, namely, at an angle of 30 degrees with the horizontal.

Proceed as follows: Project from

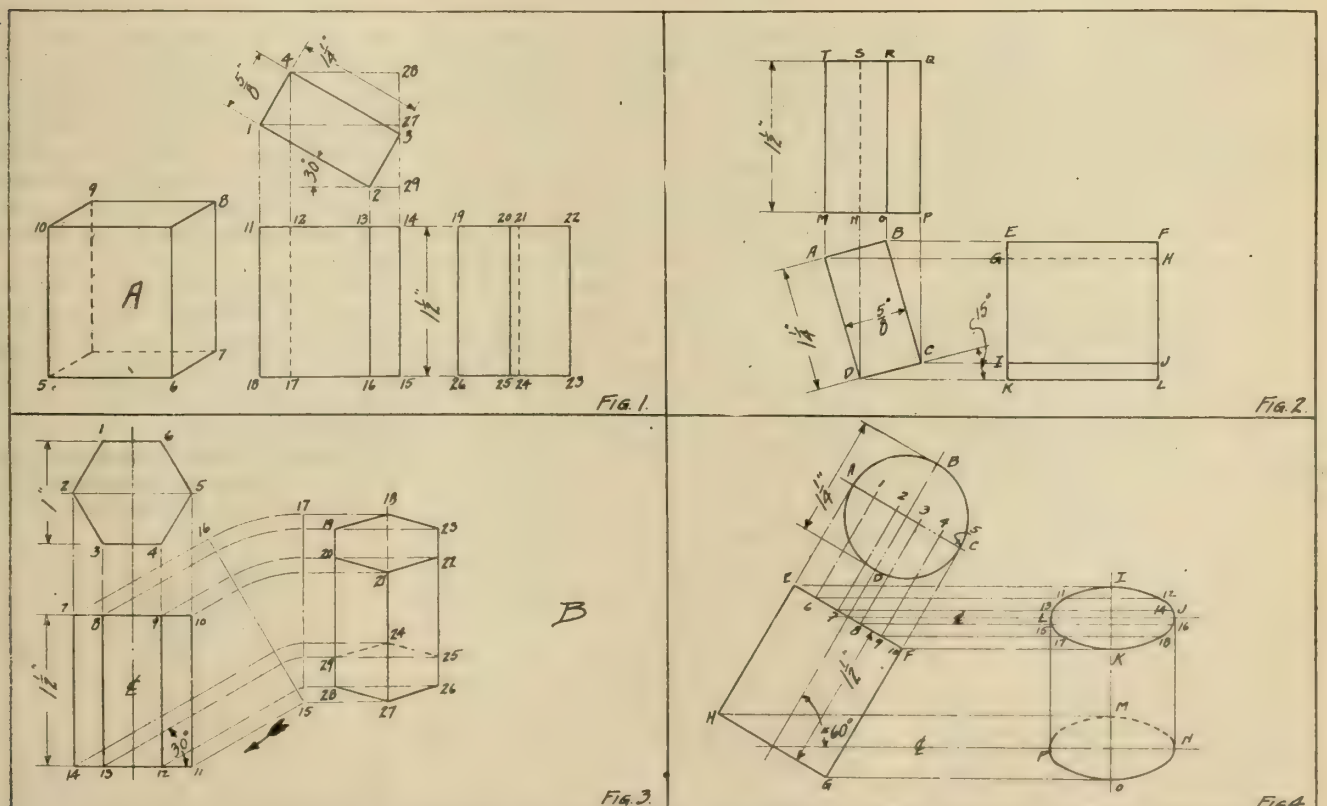
Tear off and send with drawing

Name .....

Address .....

Position .....

Firm's name.....



NOW WE START ON THE WINTERS' WORK—SEND YOUR PLATES IN AS EARLY AS POSSIBLE.

points 7, 8, 9, 10, 11, 12, 13, and 14, a series of lines each at a slope of 30 degrees, as shown. At some point as 15, which can be placed to suit your own convenience construct a line 15, 16, perpendicular to these lines already projected. With the point 15 as a centre, describe arcs from every point where the lines already projected cut the line 15, 16. Continue these arcs until they meet with the line 15, 17, which is a line perpendicular to the horizontal plane.

From these points project horizontal lines as shown till they go to points 18, 23, 22, 25, 26 and 27.

Draw the line 18, 27 as a centre line for your side elevation. This line can also be drawn in any position to suit your convenience. On each side of this line space off distances equal to ½ in., or one-half the width of the hexagon. The rest of the construction is self-apparent, for all that is now necessary is to join the various points together, as shown on the plate. Do not forget to construct at B the prism as you believe it would appear to the eye.

We now come to Fig. 4, the last on this plate. Here we see a cylinder whose axis is parallel to the plane of the paper, but which makes an angle of 60 degrees with the horizontal. In this case it is the vertical side projection which is required. As will be noted, this cylinder is 1¼ in. diam. and 1½ in. long. Construct the plan, and front projection as shown. On the centre line of plan, that is the line A C, space off into 5 equal parts as at 1, 2, 3, 4, and 5. (Note: In this case we only call for five, but this line can be divided into as many parts as desired depending upon the accuracy required).

From these points project the lines until they reach the points 6, 7, 8, 9 and 10 on the line E F. Next project horizontally these lines until they reach the points I, 12, J, 16, 18, and K, likewise at the bottom in similar manner. Now, take point 1 on the plan. Set your dividers on this point and measure off a distance from 1 to where the projected line touches the semi-circle A, D, C. Lay this distance off at the side elevation in this manner:

On each side of the centre line I O, lay off the distance just measured; this will now make the points 11 and 12, also 17 and 18, for a distance from 1 or 4, in the plan to the semi-circle would, of course, be the same.

Next, from the point 2 take a distance to the semi-circle, and lay this out on the side elevation, making the points 13, 14, also 15, 16. Of course, a distance taken on the centre line of the plan at B D will equal the distance L J on the side elevation. The student is left to complete this figure, as he proceeds in an exact similar manner at the bottom portion of the cylinder.

Above all, study this plate carefully and grasp the fundamental principles involved, after which you have nothing to fear.

As before, make your plate 13 x 9 to border lines, and 13½ x 19½ over all. Ink in all the complete work, including dimensions, figures and letters. Add in as usual the title, name, etc., then let us pass on your work, and see if you land one of the prizes. Watch for the next plate on Conic Sections, and remember the sooner we get through the next few plates, the sooner we enter the mechanical drawing in its regular shop form.

Stamped vs. Cast Wheels for Light Railway Cars

Pressed Steel is Lighter Than Cast Iron, but Not So Durable, but Both Have Their Advantages.

IN a recent number of *Canadian Machinery*, there appeared an article on the adaptation of automobile busses to railroad work. The matter of wheels is of greatest importance in the success of an application of this kind and as this may be new to some of those who wish to experiment with such cars, a little information on the subject will be given, though without going into technicalities.

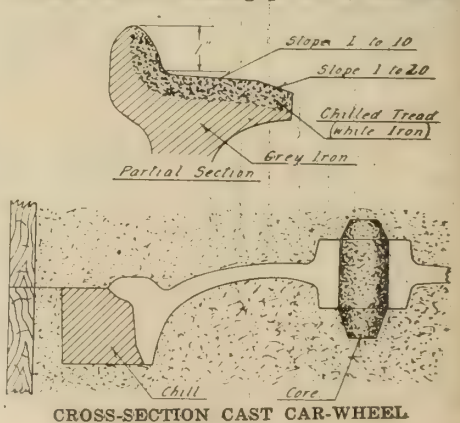
The pressed steel wheel is the lightest that can be secured as well as the most inexpensive in the first place. They are carried in stock in sizes up to 22 in., and may be had on order larger than that. These wheels are tamped and formed out of sheets of steel of 3/16 in. to 5/16 in. thickness, the tread, flange, and spokes being all one piece. Cast iron or steel hubs are riveted to the spokes. These wheels are extensively used on motor cars for workmen's use, their light weight makes them valuable where one man has to go to a distant point to do work and he must alone remove the car from the track while working.

In daily service on a heavier class of work these wheels have only one thing to commend them and that is their availability—as they are carried in stock in standard sizes and can be obtained on short notice (and at low cost). Where the weight on each wheel is as low as 500 lbs., the speed up to 30 miles per hour, and, say, a hundred miles running per day, the wheels will cut through at the base of the flange in three months; as a matter of fact, they are not intended for such severe usage, though they serve the purpose admirably if watched and renewed in time.

The vast majority of wheels in general use are of cast iron with chilled treads and such wheels naturally do unusually well on motor cars. The objection that rises to them is their over-strength and the excess of weight over what is needed for the work. Unlike the pressed steel wheel which is sold by the piece or pair, the chilled wheel is sold on a basis of cents per pound of weight—at this time around 4½ cents per lb.—and in such buying the customer pays for a great deal more weight than he needs. Some foundries have 30 in. patterns and chills but most of them make sizes 33 in. diameter or larger and these wheels weigh 500 lbs. or more and have capacities of eight to ten tons, under which loads they are supposed to give about 70,000 miles of service.

Thus the stock chilled wheel is somewhat expensive and its weight puts additional stresses on running gear parts at high rates of speed on curves. Foundries which cast street car wheels are in a position to supply lighter wheels for motor cars because the street car wheel is spoked which reduces the amount of metal in the "plate," as that part of the wheel between the hub and the rim is called. And the street car wheel is amply strong for any motor car usage. The one disadvantage of the stock street car wheel is its narrow tread, made purposely narrow so the wheel will not ride on the paving bricks laid next to the outside of the rail. Where the gauge of track is not carefully looked after, there may be sections such as on curves where the gauge is so wide that the narrow wheels will drop in between.

The objection to street car wheels noted in the last paragraph may be overcome by making new patterns and chills, but that is expensive unless a large number of wheels are required. As the additional width of tread is used and needed but little, an inexpensive method of getting this width with stock patterns may be resorted to. A temporary piece is added to an existing pattern, building



CROSS-SECTION CAST CAR-WHEEL

the tread out to the standard M.C.B., or any width desired. Then the castings are made as before except that there is a ring of unchilled metal at this one point and this soft ring answers the purpose of a safety—it gets so little service that the wear is negligible.

It is possible for any iron foundry to make car wheels of a sort. If a chill of correct proportions is made up and castings made against this, a certain amount of chill will be apparent on the face; however, it will not be the white iron of the car wheel foundry and the chill, instead of being ⅝ in. deep, will be only 1/16 in. to ⅛ in. deep. Such wheels will give a certain amount of service and have the advantage of being everywhere available. A few words in regard to the work may not be amiss.

The web (plate) or the spokes should not be straight, that is, they should not coincide with the plans of the wheel, but should be curved or reverse curved with liberal fillets at the hub and tread. The shrinkage makes necessary the precaution just named. The wheel pattern does not have to be exactly fitted on the outside, for the chill forms this part of the casting and with this machined out, the wheel should come smooth and true within 1/32 in. A pattern, of course, is required for the chill; it includes only the inner half of the flange; it should be three or four inches thick to provide mass enough of cool metal to cause chilling. Sometimes the foundryman uses water on the chill to assist. With one chill, one wheel a day may be cast.

Regular car wheel foundries use an entirely different mixture of irons from general foundries and this is responsible for the hard face obtained on their wheels. This latter is so hard that the castings have to be annealed for a week in special ovens called "soaking pits" before it is safe to use the wheels.

Metallurgy in the Manufacture of Steel

This Paper Discusses the Introduction of Vanadiaum. The Proper Selection of Raw Material. The Rolling of High Speed Steel and Other Vital Points in Manufacture of High Speed Steel

By ROY C. McKENNA

IT was with some hesitancy that I accepted the invitation of the American Steel Treaters' Society to present this paper. The writer is not a metallurgist; therefore the paper is non-technical.

The manufacturers of tool steels heartily endorse the principles and objects of the American Steel Treaters' Society. For centuries the secret art of making tool steel has been handed down from father to son. The manufacture of tool steel is still an art which, by the aid of science, has lost much of its secrecy.

No industry is more liberal in the use of scientific men, yet tool steel is today made by practical men, skilled as melters, hammer-men and rollers, each knowing his art. These practical men willingly accept guidance from the chemical and metallurgical departments. The success of this co-operation between the practical and scientific men engaged in the manufacture of tool steels demonstrates the need of a society such as this.

There are now in existence perhaps too many strictly scientific societies, several of which could carry on a scientific investigation of the heat-treatment of steel, but the results of these investigations would probably be of no immediate benefit to the practical man who knows the heat-treating of steel from a practical standpoint. The American Steel Treaters' Society recognizes that the scientific man has much to learn from the practical man; also, the practical man has come to recognize that there is not so much difference between theory and practice when discussions are not camouflaged by technical terms.

The success of the society depends upon its ability to accomplish the purpose set forth in its constitution, namely: to secure co-operation between practical steel treaters and metallurgical departments, so that they may understand each other and each benefit thereby to the end that the truth be brought to light.

A knowledge of conditions existing today in the manufacture of high speed steel is essential to steel treaters. As a manufacturer of high-speed steel, I am glad to give in this paper such information as I am able. It is well for the manufacturer to have steel treaters understand some of his troubles and difficulties, so that they will better comprehend the necessity of certain trade customs and practices, and, realizing the manufacturer's desire to co-operate with them, will reciprocate. This understanding will be mutually beneficial.

The manufacturer of high-speed steel knows and appreciates the troubles and difficultics that may sometimes arise in the heat-treating of this product. The manufacturer's aim is to make a uniform high-speed steel which will best meet the requirements of the average machine shop on general work, and at the same time allow the widest variation in heat-treatment to give desired results.

High-speed steel is one of the most complex, complicated alloys known. A representative high-speed steel contains approximately twenty-four per cent. of alloying metals, namely: Tungsten, chromium, vanadium, silicon, manganese, and in addition there is often found Cobalt, molybdenum, uranium, nickel, tin, copper and arsenic.

The selection of a standard analysis by the manufacturer is the result of a series of compromises between various properties imparted to the steel by the addition of different elements. There is a wide range of chemical analyses of various brands of high-speed steel. You will agree that, although there are being manufactured as high-speed steel, brands that do not come within the standard of what is commercially known as high-speed steel, there are certain well-defined limits to the contents of certain elements.

The steel, to be within the range of generally accepted analysis should contain over 16 per cent. and under 20 per cent. tungsten. If of lower tungsten content it should carry proportionately more chromium and vanadium.

Further discussion in this paper is confined to high-speed steels containing approximately 18 per cent. tungsten.

The combined action of tungsten and chromium in steel gives to it the remarkable property of maintaining its cutting edge at relatively high temperature. This property is commonly spoken of as "red-hardness." The percentage of tungsten and chromium present should bear a definite relationship to each other. Chromium imparts to steel a hardening property similar to that given by carbon, although to a less degree. The hardness imparted to steel by chromium is accompanied by brittleness. The chromium content should be between 3½ and 5 per cent.

The Introduction of Vanadium

Vanadium was first introduced in high-speed steel as a "scavenger," thereby producing a more homogeneous product of greater density and physical strength. It soon became evident that vanadium used in larger quantities than necessary as a scavenger imparted to high-speed steel a much greater cutting efficiency. Recently, no less an authority than Professor J. O. Arnold, of the University of Sheffield, England, stated that "high-speed steels containing vanadium have a mean efficiency of 103.9, as against a mean efficiency of 61.9 obtained from high-speed steel without vanadium content." A wide range of vanadium content in high-speed steel, from ½ to 1¼ per cent. is permissible.

An ideal analysis for high-speed steel containing 18 per cent. tungsten is a chromium content of approximately 3.85 pr cent.; vanadium .85 per cent. to 1.10 per cent., and carbon, between .62 and .77 per cent.

Sulphur and phosphorus are two elements known to be detrimental to all steels. Sulphur causes "red-shortness,"

and phosphorus causes "cold-shortness." The detrimental effect of these two elements counteract each other to some extent but the content should be not over .02 sulphur and .025 phosphorus. The serious detrimental effect of small quantities of sulphur and phosphorus is due to their not being uniformly distributed owing to their tendency to segregate.

The contents of manganese and silicon are relatively unimportant in the percentage usually found in high-speed steel.

The detrimental effects of tin, copper and arsenic are not generally realized by the trade. Small quantities of these impurities are exceedingly harmful. These elements are very seldom determined in customers' chemical laboratories and are somewhat difficult for public chemists to analyze for.

In justice to the manufacturer of high-speed steel, attention should be called to the variation in chemical analyses between the best of laboratories. Generally speaking, a steel works laboratory will obtain results much finer and more accurate than is possible by a customer's laboratory, or public chemist. This can reasonably be expected, for the steel works' chemist is a specialist, analyzing the same material for the same elements day in and day out.

The importance of the chemical laboratory to a tool steel plant cannot be overestimated. Every heat of steel is analyzed for each element, and check analyses obtained; also, every substance used in the mix is analyzed for all impurities. The importance of using pure base materials is known to all manufacturers despite chemical evidence that certain detrimental elements are removed in the process of manufacture.

The chemical composition of steel for any purpose is a basic consideration and must be such as will meet the requirements, but the quality of the steel does not depend wholly upon the chemical composition. Assuming the chemical composition to be within the permissible limits, the quality depends upon local conditions surrounding its manufacture. If the quality of steel were entirely dependent upon the chemical composition and not influenced by its "working" and "handling" in accordance with tool steel practice, the tool steel industry would be unable to exist.

The manufacture of high-speed steel represents the highest art in the making of steel by tool steel practice. Some may say, on account of our increased knowledge of chemistry and metallurgy that the making of high-speed steel has ceased to be an art, but has become a science. It is, in fact, an art, aided by science. The human element in the manufacture of high-speed is a decided factor, as will be brought out in the following remarks.

The Selection of Raw Material

The manufacture of high-speed steel begins with the selection of the raw materials which enter into the mix. Reference has already been made to the care taken by having a chemical determination made of all impurities likely to be present in ferro-alloys and also the fact that in order to make a good product, a good low-phosphorous melting iron must be used as the base.

The heat-treatment of steel in its broad aspect may be said to commence with the melting furnace and end with the hardening and tempering of the finished product. High-speed steel is melted by two general types of furnace, known as crucible and electric; the process of operation and construction of which have been completely described in papers delivered before this and other societies. Steel treaters are more vitally interested in the changes that take place in the steel during the various processes of manufacture, rather than a detailed description of these processes, which are more or less familiar to all.

The importance of properly melting high-speed steel is known and recognized by all informed on the subject, but it is not my intention to go into this important subject in this paper.

It must be of correct chemical analysis, properly melted and cast into solid ingots, free from blow-holes and surface defects. Sudden changes of temperature in high-speed steel are to be guarded against at every stage of its manufacture and subsequent treatment. Ingots of high-speed steel are relatively weak, and the tendency to crack, due to cooling strains, is great. For this reason the hot ingots are not allowed to cool quickly, but are placed in furnaces which are of about the same temperature and are allowed to cool gradually before being placed in stock. Good high-speed steel can be made only from good ingots.

Steel treaters should be more vitally interested in the important changes which take place in highspeed steel during the hammering operations than that of any other working the steel receives in the course of its manufacture.

The quality of high-speed steel is dependent to a very great extent upon its structure. I want it understood that by further reference to "structure" of high-speed steel I mean the appearance of a polished and etched specimen under the microscope. By "fracture" will be meant the appearance of the broken surface of a bar or billet to the naked eye. The making of the structure begins under the hammer, and the beneficial effects produced in this stage persist through the subsequent operations, providing they are properly carried out. The massive carbides and tungstides present in the ingot are broken down and uniformly distributed throughout the billet.

To accomplish this the reduction in area must be sufficient and the hammer blows should be heavy, so as to cause compression into the centre of the billet; otherwise undesirable characteristics such as coarse structure and Carbide envelopes will exist and cause the steel treater much trouble. Surface defects invisible in the ingot may be opened up under the hammering operation, in which event they are clipped from the hot billet.

Generally speaking, it may be said that high speed steel of good quality works well under the hammer. Ingots are first hammered into billets. These billets are carefully inspected and all surface defects ground or chipped. The hammered billets are again slowly heated and receive a second hammering, known as "cogging." The billet resulting therefrom is known as a "cogged" billet and is of the proper size for the rolling mill or for the finishing hammer.

Although it is not considered good mill practice, some manufacturers who have a large rolling mill perform the very important cogging operation in the rolling mill instead of under the hammer. Cogging in a rolling mill does not break up and distribute the Carbides and Tungstides as efficiently as cogging under the hammer; another objection to cogging in the rolling mill is that there is no opportunity to clip surface defects developed as they can be under the trained eye of a hammer-man, thereby eliminating such defects in the finished billet.

The Rolling of High Speed Steel

The rolling of high speed steel is an art known to very few. The various factors governing the proper rolling of high speed steel are so numerous that it is necessary for each individual rolling mill to work out a practice that gives the best results upon the particular analysis of high speed steel they make. Important elements entering into the rolling of high speed steel are the heating and finishing temperatures, draft, and speed of the mill. In all of these the element of time must be considered. There is no department of a tool steel plant where the personnel of the actual operators has a greater influence upon the quality of the finished product.

High speed steel should be delivered from the rolling mill to the annealing department free from scale, for scale promotes the formation of a decarbonized surface. In preparation of bars of high speed steel for annealing, the bars are packed in tubes with a mixture of charcoal, lime and other material. The tube is sealed and packed in the annealing furnace. The temperature of the furnace is gradually raised to about 1,650° F. and there held for a sufficient length of time, depending upon the size of the bars. After very slow cooling the bars are removed from the tube. They should then show a Brinnell number of between 235 and 275.

The inspection department of a high speed mill ranks with the chemical and metallurgical departments in safeguarding the quality of the manufacturer's product. They inspect all finished material from the standpoint of surface defects, hardness, size and fracture. They reject such steel as is judged not to meet the manufacturer's standard. The inspection and metallurgical departments work hand-in-hand, and if any department is not functioning properly it will soon become evident to the inspectors, enabling the management to remedy the trouble.

The successful manufacture of high speed steel can only be obtained by those companies who become specialists. The art and skill necessary in the successful working of such steel can be attained

only by a man of natural ability in his chosen trade, and trained under the supervision of experts. To become an expert operator in high speed steel in any department of its manufacture, it is necessary that the operator works almost exclusively in the production of such steel.

As to the heat-treatment of high speed steel, it is customary for the manufacturer to recommend to the user a procedure that will give to his steel a high degree of cutting efficiency. The recommendations of the manufacturer should be conservative, embracing fairly wide limits, as the tendency of the user is to adhere very closely to the manufacturer's recommendations. Unless one of the manufacturer's expert service men has made a detailed study of the customer's problem, the manufacturer is not justified in laying down set rules, for if the customer does a little experimenting he can probably modify the practice so as to produce results that are particularly well adapted to his line of work.

The purpose of heat-treating high speed steel is to produce a tool that will cut so as to give maximum productive efficiency. This cutting efficiency depends upon the thermal stability of the complex hardenites existing in the hardened and tempered high speed steel. The writer finds it extremely difficult to convey the meaning of the word "hardenite" to those that do not have a clear conception of the term. The complex hardenites in high speed steel may be described as that form of solid solution which gives to high speed steel its cutting efficiency. The complex hardenites in high speed steel are produced by heating the steel to a very high temperature, near the melting point, which throws into solution Carbides and Tungstides, provided they have been properly broken up in the hammering process and uniformly distributed throughout the steel. By quenching the steel at correct temperature this solid solution is retained at atmospheric temperature.

It is not the writer's intention to make any definite recommendations as to the heat-treating of high speed steel by the users. It is recognized that such steel can be heat-treated to give satisfactory results by different methods. It is, however, believed that the American practice of hardening and tempering high speed steel is becoming more uniform. This is due largely to the exchange of opinions in meetings such as this. The trend of American practice for hardening high speed steel is towards the following:

First: Slowly and carefully pre-heat the tool to a temperature of approximately 1,500° F., taking care to prevent the formation of excessive scale.

Second: Transfer to a furnace, the temperature of which is approximately 2,250° to 2,400° F., and allow to remain in the furnace until the tool is heated uniformly to the above temperature.

Third: Cool rapidly in oil, dry air blast, or lead bath.

Fourth: Draw back to a temperature to meet the physical requirements of the tool, and allow to cool in air.

It was not very long ago that the desirability of drawing hardened high speed steel to a temperature of 1,100° F. was pointed out, and it is indeed encouraging to learn that comparatively few treaters of high speed steel have failed to make use of this fact. Many steel treaters at first contended that the steel would be soft after drawing to this temperature and it is only recently, since numerous actual tests have demonstrated its value, that the old prejudice has been eliminated.

With an understanding of some of the difficulties inherent in the manufacture of high speed steel, I will try to give you the justification of some of the trade practices and customers which have been generally accepted.

First: SHOULD THE CUSTOMER SPECIFY BY WHAT PROCESS TOOL STEEL IS TO BE MADE?

The customer should not specify by what process tool steel is to be made. The customer is more concerned as to the quality of the tool steel and the service which it gives him. It should be left to the manufacturer to use the process which, in his opinion, produces the most satisfactory product. The customer has a right to know by what process the steel furnished him is made.

Second: SHOULD CUSTOMER SPECIFY ANY LIMITS AS TO CHEMICAL COMPOSITION OF HIGH SPEED STEEL?

The customer should not specify any limits as to the composition of high speed steel. A manufacturer should be willing to co-operate with the trade to the extent of submitting to them his rejection limits of those elements vitally affecting the efficiency of the steel.

Third: WHY SHOULD HIGH SPEED STEEL BE DELIVERED ONLY IN THE ANNEALED CONDITION?

High speed steel should be delivered only in the annealed condition because annealing relieves the internal strain inevitable in the manufacture and puts it in vastly improved physical condition. The manufacturer's inspection after annealing also discloses defects not visible in the unannealed state.

Fourth: IT IS ADVANTAGEOUS FOR THE BUYER TO CONDUCT A TEST ON VARIOUS BRANDS OF HIGH SPEED STEEL BEFORE DECIDING UPON PLACING HIS CONTRACT?

The only true test for a brand of high speed steel is the service that it gives by continued performance month in and month out under actual shop conditions. The average buyer of high speed steel is not justified in conducting a test, but can well continue to purchase his requirements of high speed from a reputable manufacturer of a brand that is nationally known. The manufacturer of high speed steel is always willing to co-operate with the trade in the conducting of a test and is much interested in the information received from a well conducted test. A test of high speed steel, to be valuable, should be conducted in a manner as nearly approaching actual working conditions in the plant in which the test is made, as is practical. In conducting a test a few reputable brands of high speed steel should be allowed to enter. The test should be conducted along lines laid down by customer and all competitors should be treated equally. All tools entered should be of exactly the same size and shape. There is much difference of opinion as to the best practical method of conducting a test, and the decision as to how the test should be conducted should be left to the customer, who should co-operate with the manufacturers in devising a test which would give the best basis for conclusions as to how the particular brands of high speed steel would perform under actual shop conditions.

Fifth: WHAT IS THE VALUE OF TESTING FINISHED TOOLS WITH A FILE? CAN SUCH A TEST BE CONSIDERED RELIABLE?

The value of the file test depends upon the quality of the file and the intelligence and experience of the person using it. The file test is not reliable, but in the hands of an experienced operator, gives some valuable information. The manufacturer of small tools from high speed steel sometimes carries the file test to extremes. Almost every steel treater knows of numerous instances where a lathe tool which could be touched with a file has shown wonderful results as to cutting efficiency.

Sixth. SHOULD SPECIAL LENGTH BARS BE SPECIFIED, OR SHOULD BARS BE OF ORDINARY COMMERCIAL LENGTH? SHOULD IT BE PERMISSIBLE TO DELIVER SHORT BARS?

The customer should not specify special length bars unless for special requirements. The manufacturer should reserve the right to ship bars of commercial length and should also be permitted to deliver short bars. That these conditions are necessary in high speed steel is due to the rejection under final inspection. A physical defect may be found in the middle of finished bar, which must be eliminated. This results in there being finished, two short bars of approximately four or five feet long in place of the usual commercial length, approximately ten feet. For the customer not to permit delivery of short bars would result in excessive, inexcusable waste. Commercially, a bar of standard size should be considered approximately ten feet long, and the manufacturer should have the right to ship the equivalent number of feet, including a percentage of short bars. 24 inches should be the minimum length acceptable to purchaser, and delivery of pieces of this short length should only constitute a small percentage of the quantity furnished. It would be very desirable if the trade would cooperate by giving to the manufacturer multiple lengths to which to work whenever practical. Much loss would be avoided by this co-operation.

Seventh: WHAT DEVIATION IN PERCENTAGES OF WEIGHT OF HIGH SPEED ORDERED SHOULD THE MANUFACTURER BE PERMITTED?

A manufacturer should at all times ship as close to weight as possible without cutting bar to length. A maximum limit of 10 per cent. over or under should be allowed.

Eighth: ARE THE MANUFACTURER'S TERMS OF WARRANTY JUSTIFIED?

The terms of warranty almost universally adopted, with slight variations are as follows: "We will replace or allow credit for any steel which, if properly selected and used, shall prove defective, but we will not allow claims for labor or damage." The universal acceptance of these terms by the buying public would prove their justification. There is no stronger or more equitable form of guarantee in any line of business.

Ninth: WHAT ALLOWANCE SHOULD BE MADE BY BUYER FOR DECARBONIZATION?

The manufacture of high speed steel has progressed to such a point that buyers, in placing their specifications, barely consider allowance for decarbonization. The allowance made by the buyer should be governed by his experience with the brand of high speed steel, and in all cases should be liberal.

Tenth: IN WHAT MANNER SHOULD A CUSTOMER WHO HAS A COMPLAINT AS TO QUALITY OF HIGH SPEED STEEL CO-OPERATE WITH THE MANUFACTURER?

A buyer should invariably ask permission of the manufacturer to return steel claimed defective, or give the manufacturer an opportunity of having one of his experienced service men inspect and examine material claimed defective at his plant. The customer should co-operate with the manufacturer to the extent of giving the manufacturer all information available regarding the details of shipment, order number under which it was shipped, date and time of receipt. This information not only enables the manufacturer to identify the material in question as his own, but gives him an opportunity of investigating the handling of the order in his own plant, and in a well organized tool steel plant it will enable the manufacturer to determine the heat number from which the steel in question was rolled, its analysis, and other valuable data concerning its working through the mill. It is only by carefully following customer's complaints that the manufacturer is able to correct faults and improve his product.

Eleventh: IS THE MANUFACTURER'S MAINTAINING OF EXPERIENCED SERVICE MEN TO HELP SOLVE CUSTOMER'S HEAT-TREATING PROBLEMS AND SECURE FOR THEM MAXIMUM EFFICIENCY AND PRODUCTION JUSTIFIED?

There is no expense incident to the manufacturing, selling and use of high speed steel which has justified itself in actual practice more than the maintaining of an adequate, competent corps of service men. The cost of the very best high speed steel is infinitesimal compared with the value of the finished tool in constant daily service. High speed steel is to-day marketed upon the basis of quality and service. The maintaining of a competent corps of experienced service men helps the manufacturer as nothing else could in maintaining and constantly improving the quality of his product. The assurance given to the buyer by a reputable maker of high speed steel that their service department will stand back of their product is well worth the extra expense.

Twelfth: IS THE PRACTICE OF BUYING HIGH SPEED STEEL BY BRAND NAMES INSTEAD OF PHYSICAL, CHEMICAL AND METALLURGICAL SPECIFICATIONS JUSTIFIABLE?

The practice of buying high speed steel by brand names is justifiable. The guarantee behind high speed steel is the standing and reputation of the manufacturer, who should maintain in his employ metallurgists and experienced service men who will defend the quality of his product and be ready at any time to heat-treat and demonstrate to buyer's satisfaction that the product furnished by him will meet any of his reasonable requirements. The customer's specifying the chemical, physical or metallurgical properties relieves the manufacturer of his responsibility as to quality. Quality is not dependent upon the chemical composition and poor high speed steel can be made within any limits of chemical contents that could be commercially met by a manufacturer of best quality high speed steel. In purchasing high speed steel by brand name the buyer places responsibility for performance clearly with the manufacturer. The specifying of physical, chemical or metallurgical limits by buyer would lead to endless controversy and would positively retard, in fact, completely arrest the progress of the industry.

The manufacturers of high speed steel should co-operate with the members of the American Steel Treaters' Society to the extent of submitting upon request rejection limits as to chemical content of those elements which vitally affect the Steel Treater's work. It is not desirable that the manufacturer's rejection limits be published broadcast. The buyer has the right to demand that high speed steel purchased by him should be within the generally accepted analysis of high speed steel. Chemical composition is a basic consideration, but the quality is dependent upon many other factors, the most important of which is the human element. No steel treater can question the fact that the results obtained from heat-treating depend upon the operator. The operator will use all modern appliances, such as pyrometer, automatic temperature control, quenching machines, etc., but the results obtained depend upon his individual experience and skill. The manufacture of tool steel is and will continue to be a handicraft industry.

Modern tool steel practice has changed from that of the past, not by the use of labor-saving machinery, but by the use of scientific devices which aid and guide the skilled craftsman in producing a steel of higher quality and greater uniformity. It is upon the intelligence, experience and skill of the individual that quality o tool steel depends.

THRUST COLLAR JIG

(Concluded from page 563)

The next operation is to bore an finish to thickness. This is done on Warner & Swasey machine and is hel by a special face plate, Fig. 6, which i made from cast iron with two stee blocks, O and P. These blocks ar bored for locating pins Q, then fitte to face plate and ground on face R, s that the collar will be perfectly cen tred after dropping the locating pins i the yoke pin holes, S and T. To remov collar from face plate all that is re quired is to slacken clamps shown a Fig. 8, then lift the locating pin Q, whic is shown at Fig. 7, the tension of the spring U, Fig. 6, being held by the small pin resting on the periphery of the face plate.

At Issoudan, France, was located America's greatest aviation school abroad. Just before the end of the war, two engineer officers, walking down the principal street, passed three doughboys. None of the three saluted. The younger of the officers grew purple.

"What do you mean by not saluting an officer?" he exploded.

They made no reply at first, and then the more composed of the trio said, "Beg pardon, sir, but we thought you were in the air service."

A novel method of testing automobile tires is employed by a manufacturing tire concern in Denver.

The track is half a mile in circumference, and it represents every feature of good and bad roads. An ingenious machine, with a long arm to which the tire is attached, propels the tire around the track.

A weight equivalent to that of a heavily loaded automobile is suspended over the tire in such a way that the tire itself carries the load. Once started on its journey, the tire continues to roll until it has given up its maximum amount of mileage.

He was a very small boy. Paddy was his dog, and Paddy was nearer to his heart than anything on earth. When Paddy met swift and hideous death on the turnpike road the boy's mother trembled to break the news. But it had to be, and when he came home from school she told him simply:

"Paddy has been run over and killed."

He took it very quietly. All day it was the same. But five minutes after he had gone to bed there echoed through the house a shrill and sudden lamentation. His mother rushed upstairs with solicitude and pity.

"Nurse says," he sobbed, "that Paddy has been run over and killed."

"But, dear, I told you that at dinner, and you didn't seem to be troubled at all."

"No; but—but I didn't know you said Paddy. I—I thought you said daddy!"

How Many Accidents Constitute a Warning?

When You See Some Fellows Hurt in the Shop, Do You Ever Stop to Think if the Cause of the Accident Can be Removed? Prevention is Better Than Cure

By J. H. M.

WE are now living in the age of "safety first." Should this statement be doubted, all one need do is look about him. Here, there, and everywhere we see miscellaneous warnings fairly shrieking out their messages. Street cars, level crossings, factories, and even the daily papers are havens of refuge for such solemn warnings as: "Watch Your Step," "Be Careful," etc., etc.

We are warned of this and warned of that, cautioned to tread carefully at every turn, and still there are accidents.

Granted that the number of these accidents has depreciated to a great extent—and that a large percentage of the remainder can be traced to carelessness, yet the point is this, that in spite of repeated warnings, people will persist in forgetting, and with serious results.

We must admit, however, that in many cases the preventive goes no further than a plastering of the scenery with cards bearing the well-known slogan, "Safety First." This is not safeguarding, but plain downright foolishness. You cannot save anyone from accident by warning only, you must get deeper into the subject, finding out how and why accidents occur. The very words "Safety First" have a deep meaning if one cares to study them. They apply to the owner of a plant just as much as they do to the employee. For example, if the owner of a plant allows such signs to be placed in his plant he must believe in the value of safety. The plant engineer, or superintendent, as the case may be, must also believe in safety, otherwise he would raise an argument regarding the placing of signs throughout the plant, which brings us to the point we are aiming at, namely, that equal responsibility should be shared by all.

Owners and executives should get together for discussion purposes, take periodical visits through their plants, looking for possibilities for safeguarding in a practical manner. It may be only an uncovered gear, an overhead belt, or some apparently simple matter that needs attention. Wherever possible, any moving part of machinery should be protected.

Makers of up-to-date machinery are realizing this truth more and more as time goes on, for the machine tool of to-day is a much better guarded tool than one made even a few years ago.

It would be impossible in a short article of this nature to touch on all the danger points to look out for. Each industry has its own particular dangers, and plant executives must acquaint themselves with these pitfalls before the placarded warnings can hope to have any effect. Workmen as a rule do not take kindly to these cards and consider them wasted money at any time, but this is especially true where danger cards are plastered all over, while moving parts, gears, pulleys, belts, and so on are all deliberately left exposed for the workmen to catch their clothing on.

Readers might be inclined to doubt the existence of such conditions, so, for illustrative purposes two incidents, each of them true, are here related to bear out the above contention.

In a certain machine shop plant at Ottawa, the writer entering the shop "gathered" that this plant at least believed in the safety idea. Cards were plastered everywhere, both in the English and French language. This was encouraging, so he looked further and discovered that all the countershaft collars were equipped with safety setscrews. Again he felt impressed, when suddenly a horrible shout went up from one end of the room, and a general rush of workmen in that direction was the next move. Of course the writer was on the job quickly and found that the trouble was with a radial drill. The operator had broken his arm.

On investigation it was found that his smock had caught on a protruding common or garden variety setscrew and broken his arm. The writer also found that it had been the third time that month that this operator had been caught in this way. In the former two cases he had luckily escaped injury, but the third case proved to be the finishing point.

It is this point which prompted the heading of this article, "How Many Accidents Constitute a Warning?"

Here was a plant using safety setscrews in their countershafts and yet allowing the dangerous type of screw to be used in a place far more dangerous than any countershaft.

The writer on leaving this plant decided that on entering the next shop on his calls he would look at the radial drills there, when, imagine his surprise to find exactly the same conditions. A similar setscrew was used on the main drill spindle to hold certain large sized drills in a home-made chuck.

Are all plants in similar danger? Luckily we can say no, for it has been the writer's pleasure to see drills properly safeguarded in every way in many a plant.

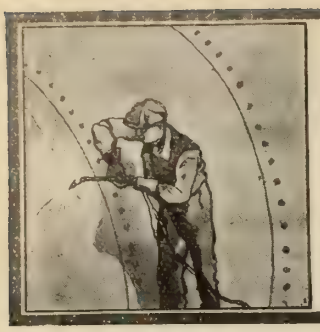
To proceed to the second and last story. This tale concerns a flour mill, which had a separator so placed that the workmen, in passing, had to be careful of exposed gearing. To ensure (?) the workmen being careful a warning sign was placed just beside these gears. In spite of this sign, men would forget, and have some piece of clothing ripped and torn. This went on for years with an average of one man every month forgetting himself and tearing clothing.

No serious accidents occurred, so no guard went up. One day, however, one of the sons of the owner of this mill went on a tour of investigation. In passing this danger point his foot slipped, caught in the gearing, and crushed both his foot and leg. As he fell he also received other injuries which resulted in his death. Of course a suitable guard was afterwards designed, but at what a cost.

We tell this tale, not for the love of repeating a gruesome story, but to impress readers with the necessity of cooperation between employer and employee. Safety signs are all very well in their way, but they must be backed up by intelligent safeguarding of machinery in general.

According to the preliminary report on the water power resources in India, drawn up by Mr. J. W. Meares, M.Inst. C.E., Chief Engineer, Hydro-Electric Survey, India's industries now absorb a matter of over a million horse-power, of which only some 285,000 is supplied by electricity from steam, oil, or water. The water power so far actually in sight amounts to 1¾ million horse-power, but this excludes practically all the great rivers at present uninvestigated. Thus it is stated that the minimum flow of the seven great rivers eastward from the Indus are capable of giving no less than three million horse-power for every thousand feet of their fall from the Himalayas, while similar considerations apply to rivers in other parts. Some doubt, however, is expressed as to the estimate of seven million horse-power in the Irrawaddy and Chindwin Rivers, given in the report of the Conjoint Board of Scientific Societies.

Recently a workman at Pablo Beach, Fla., found a whale measuring 47 ft. 3 in. in length. The monster had been washed ashore and was dead, wounds indicating a ship had struck it, or it had been attacked by sharks. It is said that it was of the arctic or Greenland variety of whale, which when full-grown attains a length of 45 to 50 ft. Since these whales seldom venture beyond the southern limit of drift ice, it probably met with death in nothern waters.



WELDING AND CUTTING

Oxy-Acetylene's Possibilities in Heavy Welding

By J. G. HILL

THE subject of "Possibilities of Oxy-Acetylene in Heavy Welding" is an extremely important one and should be considered by every one in the industry. We are all familiar with the many applications of oxy-acetylene in production work, but how many realize the work that is being done on heavy reclamation work?

It might be well to cite a few of the larger cases. Within the past year three steel plants in the Youngstown district have been able to operate due to repairs by oxy-acetylene on blowing engine cylinders where the fractures measured from twenty to forty feet in three inch thick material and where the welding was continuous for 48 to 64 hours. The time saved on this work was three to six months over the time required for replacement, and the cost of repairs was less than the cost of three hours' shut-down.

During the war rush the frame of a bull-dozer for piercing shell forgings broke. The frame weighed seventy tons and would have required at least 40 days to replace. A section 18 inches by 40 inches was welded, and the machine was out of operation just 48 hours.

Another application, which was really a wonderful repair, was made on the furnace of a steel plant, where the rivets sheared off on the circumferential seam, allowing the furnace, 80 feet in height, to sag on one side. The entire side was packed into place and the leading seam was welded and the furnace running in a remarkably short time.

The cases cited may seem like extreme ones, but such is not the case, for in our own shop for the past two weeks we have handled 16 hammer housings for forging hammers weighing 2 to 4 tons each, 3 steam hammer cylinders of 3 tons each; 1 bull-dozer frame, 3 tons; 1 engine bed, 6 tons, all in one shop during such a short time for repairs by oxy-acetylene. I believe that the heavy work is really just beginning; for instance, half of the castings mentioned above were from concerns that had never had a large casting welded before; if the work done is successful, which we certainly think it is, figure the increased market for heavy welding built up in this short time.

The supervision and inspection on this class of repairs must be far more strict than on ordinary welding job work as one failure will often put the process in bad standing for all time with a customer. I know of one who had not less than 500 heavy welding jobs, where the management prohibited welding for nearly four months because a very important machine was ruined by careless work. He overlooked entirely the good work that had been done prior to the mishap, and only by a change in his office was he "lined up" again.

While the jobs that have been described have been mostly in cast iron, I do not wish to leave the impression that steel work is not in our line for that is not the case. There is a fine example of this class of work in the nitrate plant equipment where many heavy steel welds were made successfully and, in the cases with which I am familiar, were superior to other methods of welding.

A Chicago concern recently welded some converters 11½ feet long by 30 inches in diameter, having 1½ inch plate heads. Although engineers and boiler experts had said it could not be done, and electric welders had taken their word for it, the welding work was remarkably successful. This is a good example of one place where the electric process can be beaten. A galvanizing pot is another place where the results obtained by oxy-acetylene have been superior to other processes as the gas method does not leave the porosity common to the others and cause the work to fall.

An interesting feature of heavy welding which we are doing is the repair of large castings which cannot be removed and preheated in the regular way. For example, the top flange of a low pressure cylinder on a lake vessel cracked through at one of the steam ports while the ship was on a trip. The removal of this cylinder meant tearing out part of the cabin and deck, and to preheat it meant a possible fire and worse fracture, so a screw jack was used to expand the cylinder mechanically, and by a little local heating with welding torches this casting was welded and is now in its second season of service.

Most shops are familiar with sidehand and overhead welding in steel, but cast iron welding has been considered impossible except on a nearly horizontal plane. I believe that practically any first-class shop will now weld cast iron for you in a perpendicular position, and give you a first-class job, too. While it is not recommended to do work in this position there are places on extremely heavy castings, especially when the crane equipment is insufficient, where this advance in the welder's art is very valuable.

While I do not believe that shops in general are in favor of welding large crank shafts, I believe that this field deserves a lot of experiment, as the call for this class of repairs is growing every day.

The steel mills offer another large field for heavy welding in the reclaiming of wabbless rolls. It has been the experience of most of the mills that the welded ends outwear the original ends in nearly every instance. Another heavy repair which has come to the market in the near past is welding rubber plant calender rolls. The difficulty with this job was in holding the alignment, but this has been well handled, and many shops are now doing this particular work.

With all the good work we are doing we should not overlook the bad. I believe that most shop men will agree with me that the absolutely worthless work that is being done by many people on boilers with oxy-acetylene and other processes leaves a field for the greatest improvement in the use of the process. In many districts th inspectors are prohibiting welding on boilers, and when you see some of the work that has been done you cannot be surprised. It is here, I believe, that the greatest possibility for heavy welding exists; it is profitable work, and there is a lot of it. In turning out better welders, the welding schools are helping, and the manufacturers are helping by their booklets, but unfortunately the real boiler welders are still very few.

It is interesting to note along this line that the heads of four large tank and boiler plants have stated to me recently that they have been forced to turn to welding to compete with others who have been using oxy-acetylene in their shop practice and that more than half of their inquiries specify welded tanks, or, if not specified, ask for prices on the welded product. When we consider that boiler makers have been very antagonistic towards welding, we must not overlook this condition, which speaks

*Paper read by Mr. J. C. Hill, of the Great Lakes Welding Co., Cleveland, Ohio, before the convention of the International Acetylene Association, New York City, July 15, 16, 17, 1919.

well for the possibilities of the process.

Locomotive frame welding has been the pet of the Thermit people, but I can honestly say that frames have been welded by oxy-acetylene in much less time and at a lower cost than with Thermit, and to my mind as satisfactorily if not more so.

A point concerning heavy welding which has been brought to my attention by several large customers is the fact that so many shops, which really do fine work, as far as the welding goes, send out their work with the slag and flux adhering to the castings, leaving a very rough looking job. I think that we all can possibly pay a little more attention to cleaning up the work, and it will have its effect with the customer.

Naturally the increased sales of apparatus to the various industries throughout the country cuts down the amount of small repair work materially for the jobbing shops, but these industries do not do the heavy work, and they never will. The shops that are to stay and continue to be successful must go after the big work, for there is lots of it.

THE AUTOGENOUS WELDING OF RAILS

There have already been published articles on the welding of railway rails, and it is one of the big problems in railroad work. The present practice of bolting rails together has two disadvantages; first the joints permit a jarring of the equipment passing over them, which is the cause of a great deal of the fatigue noticeable in the metals used for railway coaches and locomotives, and, second, there is the item of the passengers' comfort. There has been a constant effort made to provide a continuous or as nearly continuous rail as possible and oxy-acetylene, electric and thermit welding have been suggested and tried in the past.

Professor C. F. Keel, director of the Swiss Acetylene Society, has published, during the war, a brochure on the subject giving the results of tests made on welded joints and describing a new method of making the welded joint.

There is given below an abstract of the article.

In Switzerland because of the many tunnels and bridges, the matter of a continuous rail is important, because of the otherwise continuous shock given to the structure by joints. The railways have sought to minimize these shocks by making the rails as long as possible some rails in use have a length of over 100 feet.

The process of rail welding proposed by Professor Keel is as follows:

The base of the rail is welded and the head but the upright section is cut out by means of the torch. It is proposed to use as well the ordinary fish plates as used at present to assist in maintaining the alignment of the rails. . In the past considerable difficulty has been encountered in preserving the alignment of rails welded through the upright section, but in the present process no such difficulty is encountered. In the case of rails already laid, the author recommends that base be welded first and then the head, but if practicable, it is far more advisable to turn the rail over and weld the base from the bottom side in order that the weld may be larger. The base section, of course, is subjected by the passage of trains to a greater strain than the head section, and the weld must be made with the greatest care.

For a welding rod, Prof. Keel proposes to use a metal as nearly like that of the rail as possible. Swedish steel has been used and tests have shown that weld is always softer than the metal of the rail. The welding rods used contained some silicon and some manganese. A flux with a base of sodium carbonate and sodium bicarbonate has been used. Hammering increases the hardness or denseness of the weld. The weld on the base section is hammered when the weld is finished and while still red, the head section is hammered first when the weld is one-half completed and after the completion.

On the subject of the cost of the work, the edges were beveled by the torch and the upright section was cut out by the torch which increased the costs of performing the work. 300 to 400 litres (10.5 to 14 cu. ft.) of oxygen and 150 to 200 litres (5.25 to 7 cu. ft.) of acetylene were used for cutting and beveling each joint. If the work of welding was carried out in a shop the consumption of oxygen would be 1,200 litres (42 cu. ft.) and of acetylene 900 litres (31.5 cu. ft.); if carried out in the open air the consumption would be increased to 1,600 litres (56 cu. ft.) of oxygen and 1,200 litres (42 cu. ft.) of acetylene. One hour to one hour and one-half is required per joint made, one-third of the time is required for preparing the joint and two-thirds for the actual welding. The author suggests as a possibility of cutting down the cost the use of a preheating torch. Professor Keel also advocates the bonding of rails by welding, he makes use of an iron wire of appropriate diameter, to each end of which is fixed a plug. This plug is inserted in a hole provided in the upright section of the rail and the bond is welded in place.—Revue de la Soudure Autogene (Paris).

EVOLUTION OF THE "TANK"

Entirely new problems were involved in the development of the "Tank," as described by Sir Eustace Tennyson d'Eyncourt in his paper before the British Association.

The conditions laid down by the War Office were that the machine had to be capable of crossing gaps at least 5 ft. wide; to carry fuel and water for at least twenty miles; and be able to negotiate parapets five feet thick and 5 ft. high, having an exterior slope of 1 in 1. Weight was limited by the strength of bridges to be crossed; and the dimensions were restricted by the carrying capacity of British railway trucks and by the British and French loading gauges. The machine had to be strong enough to bear the strains to which it would be subjected, and at the same time only exert a moderate pressure per sq. in. on the ground. Further requisites were that it had to be habitable and well ventilated; it had also to be bullet-proof; it must be easily and quickly constructed, using reliable engines and other parts which could be readily produced in bulk after standardization. The combination of these essentials in a machine, which had also to be a low and inconspicuous object, proved a very difficult problem.

It became clear, in working out the general form, that the best plan would be to adopt the naval idea of sponsons on each side of the machine, each sponson carrying a gun, which was thus situated about the middle of the tank between the tracks. It was this which gave the contour to the No. 1 tank, known as "Mother," and also as "Big Willie," to distinguish it from "Little Willie." "Little Willie" was fitted with tracks obtained from America, and had an armored body with a turret mounted at the top. The American track was found to be not nearly substantial enough to stand the strain of the heavy body, armament, etc. It was therefore necessary to design a completely new form of track, and this form was developed and used for the first completed machine.

The author details the process of evolution from Mark I to Mark II and Mark III In the later machines, the aim was to use a more powerful prime mover than the 105 h.p. Daimler engine, which was originally fitted in all cases. In the Mark V type increased power was given by a six-cylinder Ricardo engine of 150 h.p., and a special epicyclic gear was introduced. The Williams-Janney variable speed gear was provided in later types, to be in turn succeeded by an improved form of epicyclic gearing.

When the need arose for a lighter tank, carrying a smaller armament and crew, the "Whippet" was designed. Increased speed was obtained by materially reducing the weight of the machine, which was only 14 tons, as compared with 28 tons of the previous types. Two independent sets of engines and transmission gears were used, each track being driven independently. The engines were of the Taylor four-cylinder type, each giving 45 h.p. These were connected by cone clutches to gear-boxes of the constant mesh type, giving four speeds forward and one reverse, and driving through worm reduction gears to chain drives, direct to the track sprockets. Steering was effected by running one engine faster than the other, or disconnecting it by one of the clutches.

During the last phase of the war, the Mark VIII type was evolved, in conjunction with the United States. Mark VIII. was somewhat larger than any of its predecessors. Except that the engines were placed in an entirely separate compartment, the design was generally similar to that of Mark V, with two 6-pounders in sponsons which were arranged to hinge inboard for transportation. Some time was absorbed in developing the Liberty engine to make it suitable for the Mark VIII tank.

WHAT OUR READERS THINK AND DO

BAYONET LOCK FOR JIGS AND FIXTURES

By ROBERT MAWSON

I had a problem when designing a fixture a short time ago that was solved in a simple and easy manner by the bayonet lock-holding device, shown in the illustration.

The surface of the casting against which I desired to exert the pressure is shown by the line A. At the lower surface of the casting being machined was a flange B, which was about 1¼ inches nearer the wall of the fixture.

It is obvious that to remove the piece from the fixture it was necessary to draw back the holding element at least 1¼ inches or more to provide the desired clearance between the casting and fixture.

It is also easy to imagine the time required to screw these back, as there were a number of such cases on the tool, providing the usual type of screws were used to hold the casting.

To overcome this trouble, in other words, to provide a quick-acting and positive holding device, the one illustrated was designed.

This is made with a threaded body C, which is made a snug fit in the wall of the fixture. On one side of the body is machined a slot D of sufficient length to take care of the distance between A and B.

At the inner end the slot is machined on an arc to an angle of 30 deg. with the vertical centre line. The shank of the pin E is made a good sliding fit in a hole of the body, and a pin F is driven in the shank, as shown.

To operate the device, the pin E is pushed up the slot by means of the knurled head until the inserted pin comes to the forward end of the slot.

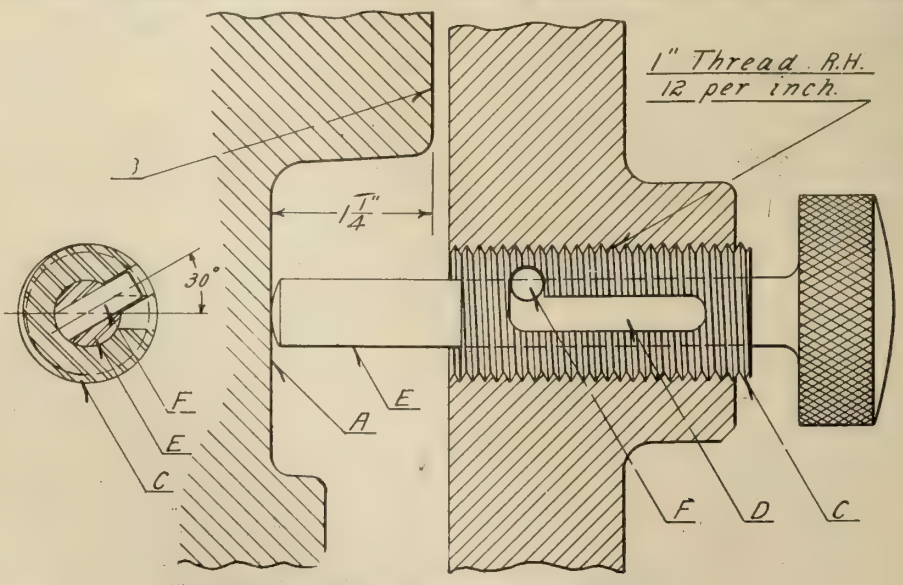
The pin E is then turned by means of the knurled head and this screws the body forward and this motion also carries forward the pin against the wall of the casting, thus exerting the desired pressure.

To remove the casting it is only necessary to turn the pin in a left-hand manner when the small pin will pass into the horizontal portion of the slot and the large pin can then be drawn back by means of the knurled head.

With this device any variations in castings are taken care of with the threaded body, which can be either screwed in or out, as necessary, and further, a solid support is afforded with the large pin as it would have to shear off the small pin before the casting would move from its location.

It might be added that straps were used to hold the casting on the fixture in the usual manner, the device described being designed only for a quick-acting locating medium.

It has now been in service for some time and is giving satisfactory service.

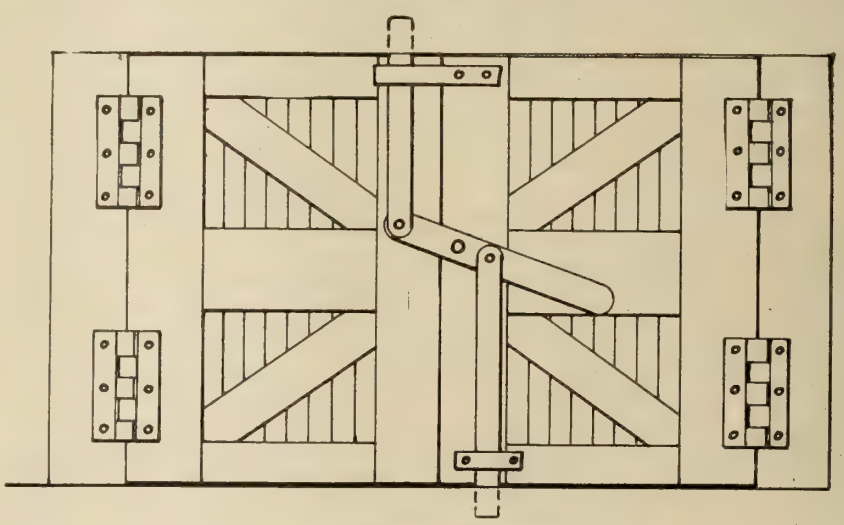


SECTION SHOWING BAYNOT TYPE OF COCK

HANDY FASTENER FOR MACHINE-SHOP DOORS

By W. S. Standiford

With the usual style of latch for machine shop and other double doors that are exposed on one side the weather allows the doors to warp, which makes them difficult to fasten. To avoid this the fastener shown in the sketch was devised, which fills the bill perfectly and keeps them straight. The device consists of a 16 inch long, 2 inch wide, and ¾ inch thick steel lever working



SKETCH SHOWING FASTENER APPLIED.

on a pivot on one door, a washer being placed between the door and the lever. At four inches to the right and left-hand sides of the pivot small holes are bored. Two U-shaped pieces are made out of flat iron bars, they being of sufficient size so as to slide easily along the bar.

Two one-inch round bars are cut to such a length that they will project 1½ inches over the top of one door and the bottom of the other. One end of each bar is then welded to the centre of each U-shaped piece, a hole being bored at right angles to the side of the piece and through the legs. A rivet is inserted through the hole in the round bar and the legs of the U section; the rivet is to be of sufficient tightness so as to allow the bar to move freely up and down. Make a guide out of a piece of a rectangular iron bar; part of the latter should be twisted while hot at a right angle. A hole of sufficient size is bored in one end so as to let the bar slip over the top of the plunger, and screw holes being put through the opposite end. This bar holds the plunger in a vertical position; it also serves to guide the round rod into a hole bored in the casting above the door. To prevent wear on the holes in the casing and sill it is best to have a short flat bar of steel having a hole slightly larger than the round rod bored in its centre, and also having screw holes made near its ends. Make another piece of the same size, and screw them to the top casing and the bottom sill. A guide is also to be made for the bottom plunger; both the top and bottom plunger rods should be tapered slightly at their ends so that they will enter the holes bored in the casing and sill easily. When the handle of the lever is put in a horizontal position, the plunger rods are level with the top and bottom of the doors.

A downward push of the handle fastens both doors, the latter opening inward. A rabbet is nailed to the outside of one door and extending over the joint, making a stormproof joint. It is customary to have a small door equipped with a lock and key (door not shown in sketch) for entering the building made in the large door opposite the one carrying the lever. This is a convenience in the winter time as it keeps the warm air in the shop, the double doors only requiring to be opened for the industrial railway or other cars that enter. Some shops have the small door on the side or the other end of the shop, but it is much more convenient to have it in one of the double doors as it saves time in opening. In conclusion, this device will be found to be a most practical and convenient door fastener and to give good satisfaction.

THRUST COLLAR JIG

By G. BARRETT

The following jigs and fixtures were used to manufacture thrust collars for automobile clutches:

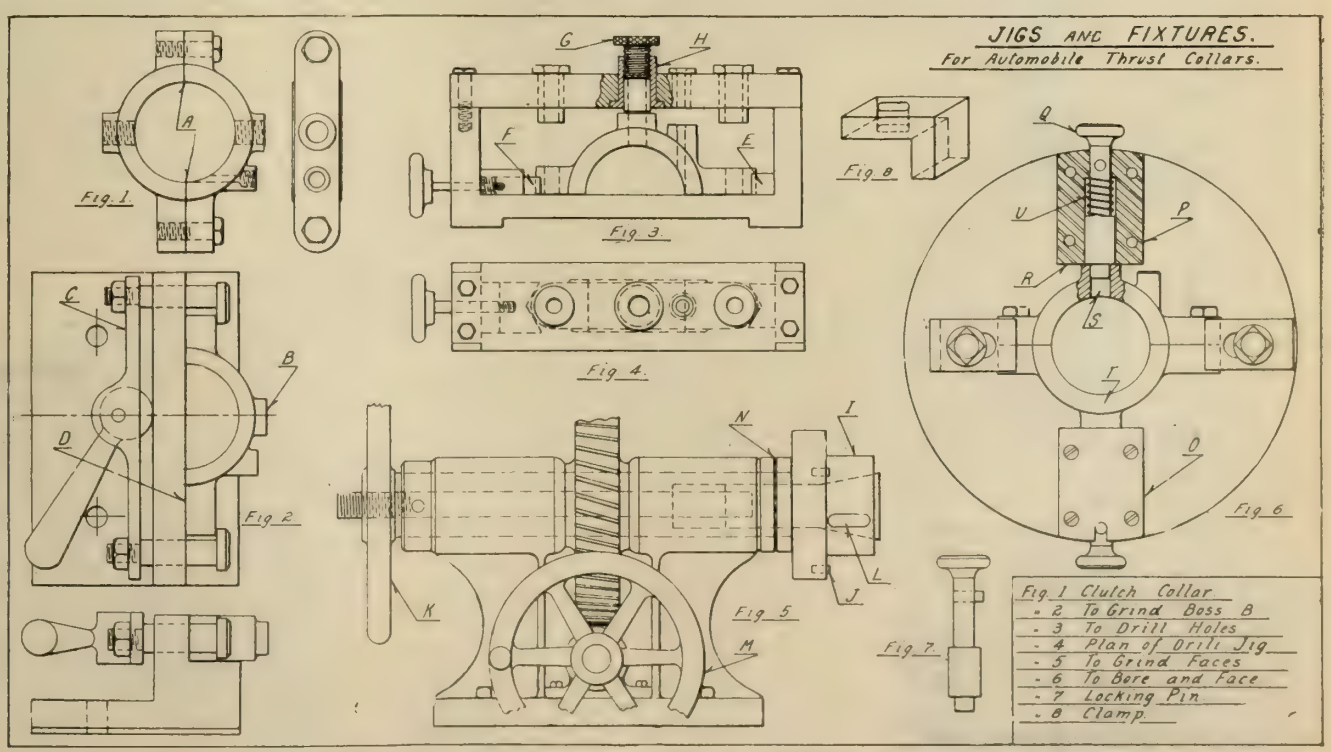
Drawing, Fig. 1, shows thrust collar assembled.

The first operation is to disc-grind one half of collar at parting A, Fig. 1, after which they are placed in fixture, Fig. 2, and ground on boss B. This fixture explains itself from plan view; Fig. 2, and end view, Fig. 3. The clamping device C, Fig. 2, is a good feature and holds the brass casting very firm during grinding; this operation was done previously by straddle milling after the collar had been assembled, but did not prove accurate enough. By the use of this fixture and disc-grinding the lugs and limit, from base D, Fig. 2, to B are kept within .004 and the production is 2,400 in 9 hrs.

The next operation is to drill bolt holes, oil hole, and yoke pin hole. These holes are drilled from jig, Fig. 3. The casting is located in jig vee blocks E and F and held by guide bush G, which is threaded and ground to fit pilot bush H. The other bushes are made a push fit in top plate of jig, so as to be replaced by ones smaller in sizes for drilling tapping hole in opposite half of casting. Fig. 4 shows plan view of drill jig and will give the reader a better idea of the vees for locating the casting and will note that E is stationary and F is made to slide in and out, so as to remove castings from the front of the operator, as there are 3 different sizes of holes to be drilled. We use Modern Magic drill sockets, which are a great time-saver where the multiple can't be used.

After drilling and tapping the castings are assembled and passed back to the disc grinder to be ground on one face; for this operation the fixture, Fig. 5, is used. The clutch collar to be ground is placed on the mandrel at I and held against three steel pins, J, and are held by tightening handwheel K, which expands the jaws L. The table of grinder is then brought forward till the casting is in contact with emery disc, then the spindle is caused to revolve in the fixture by a worm and wheel operated by handwheel M, the thrust from pressure of grinding being overcome by ball bearing collar N. This operation is also 150 per cent. faster than lathe work and more accurate.

(Continued on page 561)



GENERAL DETAILS AND ASSEMBLY VIEW.

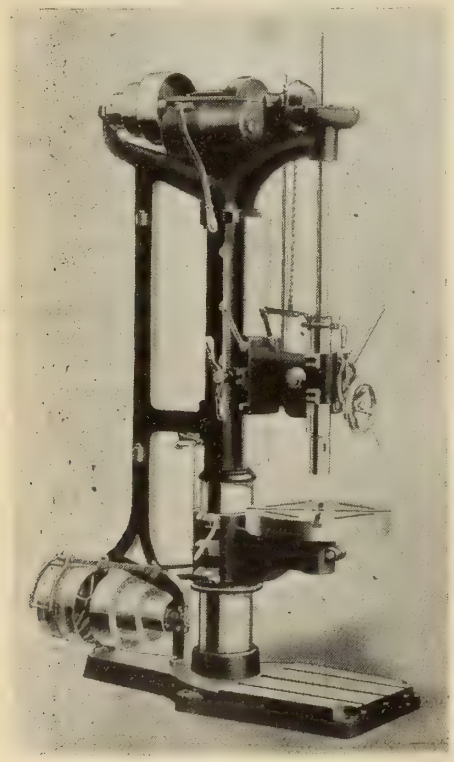
DEVELOPMENTS IN SHOP EQUIPMENT

SIBLEY DRILL PRESS

The Sibley Machine Company, of South Bend, Ind., have recently placed on the market a new sliding head drilling machine with positive geared feed, in which they have incorporated all of the proven features of their older models, with the addition of new and exclusive ones.

This machine is specially designed and built throughout, to meet the requirements of modern production methods—speeds and feeds are selective, and have an unusually wide range. The base is well ribbed and braced with tee slots for clamping work. Increased length of bearings on head and arm and substantial table support give added strength and accuracy. Head and spindle are balanced by a weight supported inside of column, with Diamond chain operating over large diameter sheaves.. Safety of the operator is assured through enclosing of gears. Belt guards can be furnished as special equipment.

One of the new and exclusive features is the fitting of all drive-shaft bearings with die-cast split bushings of a high quality anti-friction metal. These bushings are interchangeable and insure long life to the bearings and easy replacement. Drive pulleys and three step cones carry wide belts, while with the generous bevel and back gear ratios, abundant power is delivered to the spindle. Long range of the head and spindle on column permit the use of large jigs. Back gears are of the sliding type, fully enclosed, and operated by a single lever. Spindle is provided with ball thrust bearings.



SIBLEY DRILL PRESS.

Another feature of this machine is the new geared feed, with four changes and a neutral position. Feed changes are obtained by moving a knob conveniently located in the centre of the hand wheel in connection with a sliding spline, four feeds being provided for each spindle speed. The initial drive of the feed shaft is from the top cone shaft through spur gears and two to one spirals, the latter bronze and steel respectively. This arrangement is very compact, the gears run in an oil bath and are completely enclosed. The steel worm which meshes with the extra large worm gear also runs in an oil pocket. The adjustable automatic stop of new design is quick and positive in action. Hand feed and quick return of spindle is through the medium of a three-lever spider at right of feed box. Hand wheel is of large diameter.

Special attention has been given to the oiling of the machine. All bearings are equipped with oil cups, grooves and channels, insuring proper distribution to the vital points. The loose pulley is self oiling, and will run several months without attention. All feed gears in the feed case are completely enclosed and running in oil.

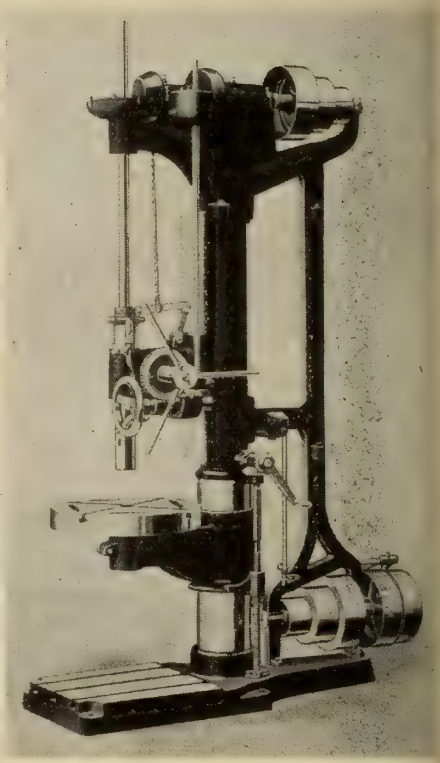
Particular care is given to the finish of this tool, spindle sleeve and all shafts being ground. All machines are thoroughly tested before shipment.

Positive geared tapping attachment, geared or belted motor drive, round or square tables with tee slots and oil pocket, oil pump outfit complete, and quarter-turn countershaft can be furnished as special equipment.

This machine is now being built with 24 in. swing.

WATTS SQUARE OR HEXAGON-HOLE DRILLING DEVICE

The Watts Bros. Tool Works, Turtle Creek, Penn., has placed on the market an arrangement for making square or angular holes. The equipment as shown consists essentially of three parts, a floating type chuck, a special drill and a guide plate.



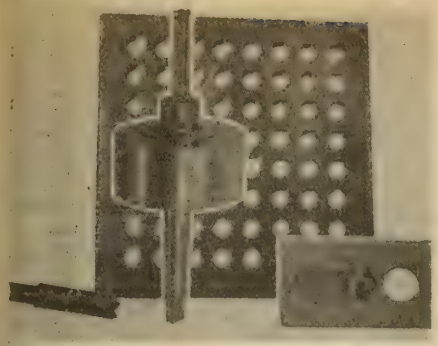
ANOTHER VIEW OF THIS DRILL PRESS.

The equipment is intended for use in any ordinary drilling machine or lathe and is recommended for work that cannot be broached, such as socket wrenches, collets, feed fingers for automatic screw machines, etc.

The tool or drill is an end cutter and works in a similar manner to an end mill. The guide plate is clamped to the work and acts as a jig, the floating chuck simply permitting the necessary lateral motion of the tool when cutting.

In operation a round hole is first drilled, leaving as little stock as possible for the special tool to remove as shown by the large plate in the illustration. The small plate shows the guide with the tool in the guide hole. The holes on each side are bolt holes to clamp the guide plate to the holder or jig.

The device is not recommended for deep holes and is limited to depths of two and a half to three times the diameter of the hole. It is furnished in four sizes with capacities ranging from ¼ to 1½ in. holes. The guide plates are ordinarily made in round shapes but can be furnished in special sizes and shapes for jigs. The chucks can be used on other work when not being used for angular holes.



THE WATTS SQUARE OR HEXAGON DRILLING DEVICE.

The Globe Engineering Co., of Hamilton, Canada, are handling this product in Canada.

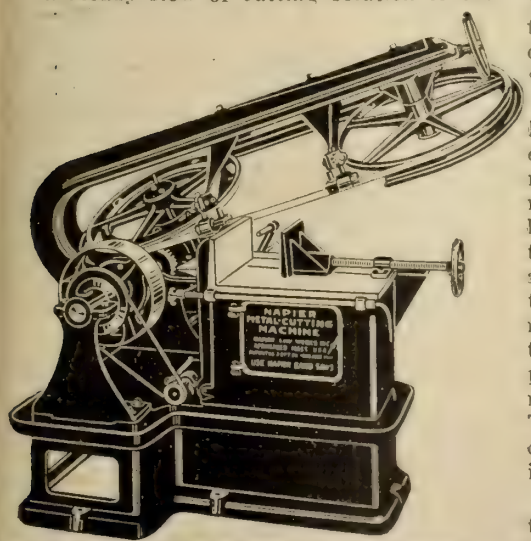
NAPIER BAND SAW, CUTTING-OFF MACHINE

The cut herewith illustrates the new type of Napier Metal Cutting Machine. It is claimed that the band saw principle has many advantages over the ordinary reciprocating hack saw machine, inasmuch as the movement of the saw blade is continuous in one direction.

The plane of the revolving band saw is so inclined that the cutting portion is lower than the return section, a condition that permits of cutting bars of any desired length. An interesting point in this machine design, is the system of counterbalancing the horizontal cutting arm, a factor that provides for gravity feed, and permits of self adjustment to the varying densities and characteristics of the metal encountered. Owing to the inclined position of the saw blade it is necessary to provide some means of bringing the cutting portion of the blade to a vertical position. This is accomplished by two roller guides that can be adjusted on the cutting arm, and these guides may be so located that the cutting section of the blade can be kept at the minimum length when small diameters are being cut. This feature likewise assures very accurate cutting of the bars.

The machine is equipped with a small rotary pump (belt driven) that supplies a steady flow of cutting solution to the work when desired, and the lubricant is delivered in such a way that the saw teeth are washed free of dirt and cuttings, and the blade kept perfectly cool. This cooling of the blade is also assisted by the relatively large wheels that carry the band saw, so that any heat generated by the blade passing through the work, is rapidly decimated into the larger body of cast iron. The wear on the teeth is evenly distributed throughout the entire blade, so that the possibility of drawing the temper is practically eliminated.

One of the most important advantages claimed for the Napier machine is the thinness of the kerf—less than .05 inch—and the resultant small waste of metal. In cutting high speed and alloy steels, this saving is very considerable. These saws have a capacity of 10 by 10 inches on any class of work. These can be supplied in either belt or motor driven types. All bearings are of substantial dimensions to insure long life under severe service.



NAPIER BAND SAW, CUTTING-OFF MACHINE

The saw blades are made in long ribbon strips and may be cut off and brazed to the desired length. The teeth are milled at such an angle as to give maximum cutting efficiency, with a strong broad base or root, that prevents the teeth from losing their set. The teeth and a slight portion below the root, are tempered exceedingly hard, and the remainder carefully toughened, leaving the blade with sufficient flexibility to prevent checking in its endless turning movement around the supporting wheels. The blades are made of high-grade crucible steel, and in widths from ¼ inch to 1 inch.

Lyman Tube and Supply Co., Montreal, are the sole Canadian distributors for these Napier machines.

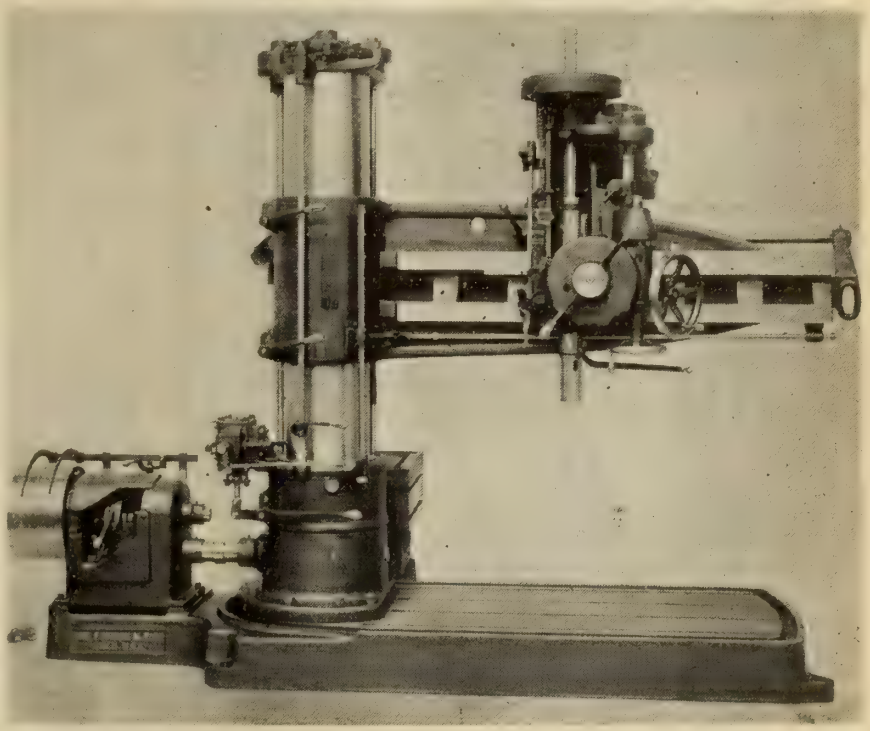
COMBINATION PNEUMATIC AND HAND-CLAMPING DEVICE

A new arrangement for clamping the column of their drills has been recently placed on the market by the Fosdick Machine Tool Co., of Cincinnati, Ohio.

This arrangement is quite different from the usual devices of this kind, in several respects. It is applicable to any of the Fosdick 4, 5 or 6-foot Heavy Duty Radials.

The most noticeable feature is the location of the cylinder, which not only brings the pressure directly to the point of clamping, but eliminates quite a number of the usual working parts.

It will operate equally as well on extremely high or extremely low pressure, and during tests operated very successfully on 45 lbs. pressure.



VIEW SHOWING THE PNEUMATIC CLAMPING DEVICE.

Relief valves are provided for each end of the cylinder, and are regularly set for a pressure of 45 lbs., although 150 lbs. or more will show no shock or jar in clamping or unclamping.

This is accomplished by an air cushion at each end of the cylinder, formed by additional ports in the valve, to cause a compression at the proper termination of each stroke.

The valve (a six-ported flat disk valve) is operated by mechanical connection to a horizontal shifter bar running along the entire length of the radial arm. The advantage of this device is that it has no connection with, and does not interfere with, the moving of the spindle head.

In case of failure of the air, pet cocks at each end of the cylinder are opened, and the ordinary method of clamping by hand is used.

No Apologies Needed

A MACHINE erector finished up a certain installation running into some thousands of dollars. He was in a hurry to get away to another bit of work, and at the end of the week announced that the machine was ready to operate on Monday morning when the plant started.

"Better stick around until Monday to see that it goes all right," remarked the superintendent. "Last time we had an outside man here we had to bring him back to get his machine started right."

"That machine will run," replied the expert, as he continued to pack his grip, "and there will not be any need to touch it."

"What makes you so certain?" queried the superintendent, "you haven't tested it yet?"

"So?" remarked the expert. "That machine was tested, piece by piece, in the inspection department long before it was ever erected. I know every operation in its make. I was almost going as far as to state that I know every man who attends to every operation. I know that our firm never allows anyone to take a chance. I am so certain that that machine will run on Monday morning without ever having seen it operate in your plant that I will come back at my own expense if you wire for me on account of trouble."

The superintendent was a little doubtful as he saw the expert leave on the Saturday train. Monday came, and the power was turned on the new machine. The superintendent had allotted a good mechanic to run it, thinking to give it a fair trial. He dropped around a couple of times in the morning and again toward five in the afternoon.

"Anything wrong with the new machine?"

"Great. Works exactly to dimension. Never saw anything better."

When the superintendent returned to his office there was a wire from a city some ninety miles off, from the expert who had set up the machine. It said just this: "Why don't you send for me?

"If you are the head of a concern making goods, if you are a foreman, if you are a mechanic, are you backing up the men who are on the road for you in this matter? Have your men got to be good apologists in order to get your lines in the shops? What more does a man who goes out want than to be able to say "That machine will run. It has been tested and inspected piece by piece before it was ever assembled. I know the men who built it, and I know what sort of work they can do. I can stake my entire reputation on its performance."

Accomplishment of that sort will do more to put goods on the market than all the catch-penny slogans that can be pasted and painted on your goods and in your advertising propaganda.

Never ask an outside man to apologize for lack of excellence in your product.

Not a Mechanical Problem?

WITH varying degrees of complacence the residents of the district affected would read in the papers a few days ago, that the price of milk was to be increased for Toronto, and of course that would mean the price of butter as well. The latter expected to get out of its present lowly rut at 65 and 70 cents and march right along until it camps at the 90-cent mark.

Milk is expected to go to 17 or 18 cents a quart. A dollar, it is expected, will soon buy only 11 or 12 pint tickets.

Perhaps you may ask what this has to do with matters in which we are primarily interested, such as mechanical, engineering and selling problems. Just this. Forcing up the price of things that the men in the shops and their families have to eat in order to live means keeping afire the feeling of unrest and discontent.

Every time the man in the shop sees where there has been a meeting of men engaged in a certain line of business, and following that meeting there comes a notice of an increase in the price of something he must buy for his family, that man in the shop is going to set to work to get sufficiently more from his employer to keep pace with the stride being set for him by the producers and dealers.

It is his failure to keep pace with the increasing costs that keeps him on edge.

Although fundamentally not a mechanical problem, the meeting together of men for the purpose of further bolstering up prices of milk and butter, is very much a problem of every mechanic in the region affected.

It is likewise and very directly a problem of every employer of labor.

Another two-cent jump in the price of milk may do damage so great as to be altogether out of keeping with the size of the increase.

AN evangelist who was conducting nightly services announced that on the following evening he would speak on the subject of "Liars." He advised his hearers to read in advance the seventeenth chapter of Mark. The next night he arose and said: "I am going to preach on 'Liars' to-night and I would like to know how many read the chapter I suggested." A hundred hands were upraised. "Now," he said, "you are the very persons I want to talk to—there isn't any seventeenth chapter of Mark."—Boston *Transcript*.

* * *

A CAPTAIN of a lake vessel who was floating around on a piece of wreckage states that he was refused help by a passing ship. A case like that should be sifted to the bitter end to find out all the facts. And if the facts bear out the claim there should be third degree treatment right straight off.

The Old Family Group

IT is not pleasin' unto me, in fact, it grieves me sore, to see some things a-passin' we loved in days of yore—folks seem to be all changed about in this here awful age, a-tearin' here and there, by gum, in one mad, giddy rage.

It causes me to shed a tear the way they've put the boots to them there photos that we called the old-time family groups.

I love to gaze upon them things, their faces and their gowns—their countenance set for the pose, all freed from grins and frowns. They set there lookin' back at me, that group took years ago, poor things not knowin' that them groups was out-of-date and slow.

Why, when they go out nowadays to get their likeness took, folks try to look like some front page from out a "movie" book. The women get a yard or two of fly-nets round their bones, by far too flimsy and too thin to venture from their homes. They gaze up at the rafters, 'cause the photo man says so; they're dressed in some partic'lar style with no place much to go. And when their friends grab off the prints they snicker and they grin; the things they say they constitute a high crime and a sin. But to their faces they cry out, "Oh, excellent! Oh, fine! Prunella, dear, your profile shows a snout that is divine!"

Likewise when Dad goes out to sit before the camera man, he has to have an egg shampoo, also a meal of bran—he looks as great men look each day, as though he'd like to feel just how 'twould be before the night to swing a million deal. Why, if Dad pulled that picture face when trudgin' 'bout the house, we'd swear he was recoverin' slow from some hard cider souse.

Of course, we've got to be in style like all the other folks; it aint no use in laggin' like a lot of has-been blokes. But all the same, them family groups look powerful good to me, when Dad was young and handsome and Maw was twenty-three. I like to look at them, I do, just settin' there, by heck, without no care or worries a-campin' on their neck. No cheese cloth wrapped about Maw's chest, nor yet upon Dad's jaw is fixed an attitude to state he's gone and bust the law.

Ah, yes, I know it's out-of-date to have a family group, but for them photos nowadays I don't care one durned whoop. Lead back the good old family group with pleasant face and sweet, with palm trees rustlin' in the rear and foostools 'round their feet.—ARK.

It is claimed that the best method of utilizing the peat resources of Canada efficiently would be by gasifying it in gas producers, as in this system the valuable by-products contained in the fuel could be recovered. The combined nitrogen of the peat can be economically secured in the form of ammonium sulphate, and the valuable fertilizer, with the peat ash containing potash and phosphoric acid, could be restored to the land from which the peat has been taken. Peat tar is a source of refined pitch and tar, candle wax, lubricating and burning oils, and powerful disinfectants greatly exceeding carbolic acid in germicidal strength. The valuable by-products of methyl, alcohol, acetone, pyridine bases and crude acetic acid, can be recovered from the aqueous distillate from the producer.

* * * *

For a long time the waste steam from steam-engines has been turned to good account, but there have been difficulties in the way of using the exhaust gases from a gas-engine as they readily attack the metal of the conduits. However, the difficulty is being overcome, for a New Jersey candy factory has an installation in connection with a sixty horsepower engine which is used to heat the factory. The gases pass through an economizer made of cast-iron, with the passages to the different sections staggered so that all parts are heated for the whole length. Water circulates in jackets surrounding the gas passages.

Where Industries Will Go

ACCORDING to reports, a number of the industrial centres of Canada, particularly in Ontario, are holding out very plausible looking inducements to firms looking for locations. In some cases it does look as though there were a sort of a competition on, with the competitors tossing up free sites, tax exemptions, free water, cheap power and what not to land the bacon.

The city that sets out seriously to become an industrial centre has to do something deeper than any of these flash-in-the-pan things. Industries do not gallop away for trinkets if they are going to grow well.

The city that has a large part of the battle fought is the city that has conditions that are favorable to the development of a good labor market. And what's that? Simply that it shall be a good, wholesome place for a man to bring up his family; a place where he can own property without having to hand out a slice to every speculator and manipulator; a city where it will pay him to settle with a view of becoming a fixture; a city where the houses have a little land to the sides and rear—in short, a city which, when he has been away for a time, looks powerful good to him on his return.

Don't make any mistake, the firms that are looking for sites for factories in Canada, if they represent worth-while parent concerns, can take these conditions in, and they put them down very close to the top of the list.

A municipality is only fooling with itself and joking with its people when it imagines it can worm itself into being an industrial centre on the strength of a free site and exemption from taxation.

An industry is not like a convention, which goes where it is invited. The worth-while industry is going to locate where it has a chance to grow, and it cannot grow without a well-housed, contented working force.

Can your city line up to these considerations? If not, your first step is in getting your house cleaned and in shape before going out with a beckoning forefinger to worth-while concerns that are seeking locations in this country.

VICTORY Loan workers were dined in a Toronto hotel. The little chap who scrubs along and pays for a bond is the chap worth dining.

* * *

MILK goes up on December 1, according to reports. When we stop to think how we used to try and make calves drink the stuff out of a tin bucket we weep, gentlemen—we weep.

* * *

THE doctrine of decreased production and a bob-tailed work day is not going to put Canada where she belongs in the industrial world.

IF THE REFORM LEAGUES WOULD ONLY GO ON STRIKE!
—New York "World."

MARKET DEVELOPMENTS

Securing Material is the Greatest Problem Now

Shipments of Steel Coming Through at the Rate of About 65 Per Cent. of Normal Times, While the Demand is Very Keen—Canadian Firms in the New York Tool Market

SECURING of supplies is becoming more and more a problem with the industrial world in Canada. Many firms are realizing now that dealers and salesmen of steel and machinery were quite right some months ago when they warned them that there was a serious shortage ahead. Firms that went into the market then and got their business booked are getting deliveries now. Firms that did not have simply to content themselves with getting what they can, and with knowing that any business they may put in now has a great procession ahead of it, making deliveries very uncertain. The premium market is coming to be more and more openly recognized in the steel business, and many mills that have not been known as being in the premium class before are now selling at a price based upon their ability to deliver. There is also a tendency, although hard to locate, that tries to hold back a certain tonnage in prospect of a very active and high market later on.

The shortage of steel, coupled with restriction on the use of coal, has a tendency to make buyers a little more conservative. But for all that there is a nice volume of business moving in the machine tool market, and the business is well scattered, no one industry doing all the buying. Several Canadian firms have fairly large lists in the New York machine tool market this week.

Canadian machinery dealers are recognizing more and more that the day of specialization has arrived and they are preparing to meet this new situation. One firm this week has sent its best man to study production methods in other countries, and he will devote his whole time to pointing out, on his return, where operations that are now done on a general machine should be turned over to a machine built especially for the purpose. It is really applying the single-purpose machine idea, which secured such results during the war.

Copper prices in the scrap market sagged during the week. It is hard to sell copper owing to the rate of U.S. discount, hence there is an accumulation.

MONTREAL MARKET LOOKS FOR FIRM OR HIGHER PRICES IN STEEL

Special to CANADIAN MACHINERY.

MONTREAL, Que., Dec. 4.—There is little doubt in the minds of the local steel men that the industry is gradually returning to a position where higher prices will be the order of the day, and these may not be far short of those prevailing throughout the later years of the war period. It is probably true that the demands were greater a couple of years ago, but production was in accordance to existing requirements. Now we are confronted with abnormal post-war demands for steel, and the attitude of labor prevents the full utilization of production facilities for the relief of a situation that is daily becoming more serious in the resultant effect upon this country in particular and the world in general. While the unreasonable struggle continues, the people at large must continue to wait and suffer patiently. With the near approach of winter the difficulties of transportation will be added to the scarcity of fuel and many factories will likely be faced with a shutdown or curtailed production. The closing of navigation will increase the difficulties of obtaining coal from the Maritimes, so that extreme conservation will require to be exercised to avoid a serious shortage of coal this winter.

Steel Lines Advancing

In view of the conditions that do exist, and which are being constantly aggravated by the coal strike and the general disturbed state of transportation, a factor that will be further pronounced as winter approaches, the possibilities of seeing the prices of steel commodities back to a war level, is becoming more and more certain. The demands for every class of domestic steel is so pressing at the present time that any long duration of under-production would create a serious situation, and one that has little chance of alleviation as long as fighting differences exist between the workers and the operators. It was stated by one dealer here that from the coal mines of one large U. S. steel mill not a ton of coal had been mined in nearly three weeks. Their stock on hand will only last a short time and when this available supply is consumed suspension of mill operations will necessarily have to follow. It is estimated that current production of American mills is 50 per cent. below normal and trade requirements are far above the average mill capacity of the country. Mill refusals to accept bookings are common procedure, and where producers are accepting business, no assurance is given as to when the material will be delivered.

Local warehouse stocks are gradually being depleted of the lines in general demand, and the uncertainty of renewing these stocks is becoming a matter of some concern, and this condition can only have one logical result—a stronger market at advanced prices.

Canadian mills are benefiting by the falling off in American production, particularly in those lines that are within the range of the mills. Dealers here are anticipating a gradual return to higher market levels, and some would not be surprised to see "war" quotations this winter. Local prices on chequered floor

BECKER

Belt Driven Millers

The Machine that Gives the Smooth Finish

Stringent shortage of labor during the war put a premium on machinery of superior productive ability. Never was the capacity and value of Becker Millers better emphasized than during that period. And Becker Millers will always continue to demonstrate their ability to return maximum production for minimum expenditure of manual effort.

Send us blue prints of your work and other data and we will submit estimates on Becker production. Adopt this "safety-first" course; it may mean added profits to you.

plates have advanced about one cent per lb., the price quoted being 7½ cents for the 3-16 inch, and 7 cents for the ¼ inch size. Plates have been advanced $7 to $10 per ton, the new quotation being $5.00 per hundred for ½ inch and up, and $5.25 for 3-16 inch. Quotations on billets have been changed to conform to the prices f.o.b. Pittsburgh, and these advances range from $4 to $7.50 per ton. Forging billets are now quoted at $56 per ton. Sheets is one of the products that has been hit by labor troubles, and supplies of this commodity are considerably below the trade demands. No. 10 gauge, black sheets, are now quoted at 6 cents per lb. Boiler tubes are still hard to secure and prices are firmly held. The price on 1½ inch seamless and lapweld, and on 1¾ inch lapweld, has been advanced 50 cents per hundred feet.

No Change in Metal Situation

Scarcity of finished materials still dominates the metal market and uncertain deliveries of these lines is the chief factor of the present disturbed state of affairs. There is a fair demand for ingot metals, but trade requirements for sheets are much larger than production can take care of, and output may be still further affected by the increased shortage of coal for operation of smelters and refineries. Dealers are holding firm to the nominal prices now quoted, but anticipate a stronger market.

Tool Movement Quite Good

The question of shipment is still a factor in tool business, and sales would probably be larger if users could be assured of a definite date for delivery. This, however, the manufacturers or dealers are unable to do, and the uncertainty in this connection will be further evident while labor and transportation troubles occupy the greater attention of industrial executives. Reports of local dealers differ in the extent of business transacted, but the general impression is one of good business, with sales quite fairly divided between new and used machinery. Existing conditions are assisting the Canadian manufacturer of tools, and dealers are doing what they can to induce purchasers to patronize Canadian makers of tools they are in need of. The conditions are such that prices may show advances in the near future.

Non-ferrous Scraps Weaker

The situation has again developed a dull tendency and trading has taken on a quiet trend. The disturbed conditions across the line has been reflected in this district and dealers are not keen to predict what the early conditions will be. The coal strike has not aided the re-establishment of normal industrial activity and curtailment of general enterprise is second only to the inability to meet the country's requirements for steel. The demand for scrap is proportionate to the steel production and with many American mills closed or contemplating closing, the consumption of old material in larger quantities must await the return of the coal and steel workers to their usual employment. The local movement of scrap continues in fair volume in the district, but non-ferrous scraps have weakened as a result of the lighter demand in relation to available supply. Coppers are quoted at from 14 cents for light to 17 cents for heavy and crucible, a decline of one cent per lb. Brass scrap has also developed a weakness and prices are marked down from 1 to 2 cents per lb. Iron and steel scraps are comparatively firm, but the undertone is unsteady. Wrought iron, on a decline of $1.00, is quoted at $9 per ton. Machine shop turnings at $7 shows a drop of 50 cents per ton.

POINTS IN WEEK'S MARKETING NOTES

The scrap market shows the following lines as being stronger and higher in price: Heavy melting steel, steel rails, malleable iron. Coppers, on the other hand, are not so strong, and prices are off compared to recent offerings.

—

An acute shortage in this district exists in bar products and semi-finished steel. Users are pressing the mills pretty hard for delivery, but the response is still short. About 65 per cent. of a normal volume is coming across now.

—

Several large enquiries are in the New York machine tool market now, among them being a couple from Canada.

—

A nice order for carbon drills was placed by the National Railways during the week.

—

A couple of shipments of machine tools came through this week in advance of promises, a thing rather unusual in recent years.

—

Dealers report a very satisfactory volume of business moving. The fact that prices remain high does not seem to interfere with sales at all. Delivery is still the chief consideration.

—

Canadians are quite interested in the sales of machine tools and equipment being held by the U.S. army department, clearing out the war shops. Some who have attended these report that prices run high, in several cases going, under bidding, past the price that would be asked for the machine when new.

DELIVERIES NOW ABOUT 65 PER CENT.

But Not Fast Enough to Keep Up With the Requirements of the Trade

TORONTO.—For the first time in many weeks some of the machine tool dealers in this district are willing to admit that there is some signs of improvement in the deliveries that are being made to them by their principals.

The steel strike may be broken, but it is not showing much yet in the deliveries that are made. It sizes up the situation fairly accurately to state that deliveries are about 65 per cent. of what should be coming through in normal times.

The Machinery Market

Prices are firm in the small tool section, with a good-sized volume of business moving. Toronto dealers received a nice piece of business from the National Railways during the week for carbon drills. Buying at present is becoming more general, although some of the firms that may be affected by the coal shortage are not keen to put in any very great stocks. Plants that are working on automobile parts are increasing their operations almost every day, adding a few more machines to their capacity, and this all means that there is a greater day-to-day call for supplies.

There have been a couple of agreeable surprises during the last few days regarding deliveries of machine tools. Some firms seem to make a specialty of not promising anything very close at hand, and then trying to improve on the delivery schedule that has been tentatively suggested. It is much preferable to the rash promise of a good delivery, which can never be carried out.

According to the New York letter to CANADIAN MACHINERY, appearing on the next page, a couple of Canadian firms are in the market for some rather extensive equipment.

About 65 Per Cent. Now

According to the office of one of the large American corporations in Toronto, the shipments of material from the strike zone in United States entering Canada, are about 65 per cent. of what should come across in normal times. Asked if that was any improvement over the past weeks, the dealer admitted that it was not, and stated his belief that it would be some time before a real improvement would be shown. There are troubles that have not come to the surface in the strike, and apparently a labor shortage is now going to crowd in on the space lately occupied by the strike in the centre of the stage.

Booking is still going on, but many of the companies here are not keen to write more business until the prospects are better for getting outstanding business converted at the mills. There are many manufacturers who are anxious to know when their material is coming in

GEOMETRIC

SELF-OPENING DIE HEADS

"YOU CAN'T BEAT 'EM"!

It is not the manufacturers of Geometric Self-Opening Die Heads who make this statement, but the users of the tools.

This is the reason that besides being the originators, we are known as the

LARGEST AND BEST KNOWN MANUFACTURERS OF AUTOMATIC THREADING TOOLS

The big question is: Have you applied Geometric Screw Thread Cutting Tools to your threading work?

THE GEOMETRIC TOOL COMPANY

NEW HAVEN CONNECTICUT

Canadian Agents: Williams & Wilson, Ltd., Montreal: The A. R. Williams Machinery Co., Ltd., Toronto, Winnipeg and St. John, N.B. Canadian Fairbanks-Morse Co., Ltd., Manitoba, Saskatchewan, Alberta.

There is a marked tendency now, and it will likely increase in the future, to press the companies for material that has been booked now for some months. Bar products and semi-finished goods are away off for the present. There is quite an activity in the premium business just now, in fact the price of a good many sales is really based on the ability to deliver the material within a specified time. It often pays a manufacturer to put up a premium for quick shipment, rather than see his workshop shut down and his organization scattered. In some cases mills are asked a $7 bonus on plate. The Steel Corporation, as far as this paper can learn, has not departed from its schedule that has been in effect for some months. However, the man who has the goods to deliver is apt to get a better hearing than the seller who puts a three to six months' space between the order and the delivery. There is a great deal of premium business being carried on both here and in United States.

It does look as though there were going to be a lot of business piled up against the spring operations of the mills. There has been a lot of business sent in from this district, and it will be months yet before the last of it gets a ride across the border.

The Scrap Metal Trade

Coppers were marked down in the list of what the dealers would pay for old material this week. The chances seem to be that the prices may go still lower. The reason for it seems to be in the much-talked-of rate of exchange, and it comes about in this way. It is becoming a hard matter for United States to sell copper abroad on account of the way in which the money of other nations is discounted at Washington. For instance, taking the present price of No. 1 electrolytic, at 19c, it would cost England about 25c, it would cost France 30½c, while the Germans would have to pay about $2.50. It all means that these people are going to stay out of the United States market for copper supplies. There has been some reduction in output, but not enough to balance the way in which material is piling up, owing, as stated above, to the rate of exchange. The coal strike and the steel strike, now practically over, are still holding back trade.

The ferrous metals are showing up much more favorably, and they are very much in demand. Heavy melting steel went up $2.50 per ton, while advances were noted as follows in other lines:

Steel rails up $2.50 to $16; malleable iron up $3 to $20.

"As things stand at present," said one dealer to-day, "it looks as though malleable were about the cheapest thing on the market. Malleable and cast scrap are very much the same, both of them being governed by the price of pig iron. Although there has been a recent jump of about $4 per ton in pig iron, malleable scrap is selling for $20, and No. 1 scrap at $25." Many foundrymen, though, are not disposed toward using malleable scrap. They claim they cannot get it to work with any other material, as they can do with stove plate. Malleable is hard when first cast, then heat-treated, but when it comes back to be recast it returns to its hard state. It is used mostly in the tail-ends of heats or for casting some job where the analysis of the material is not of much importance.

NOTHING LIKE A CAPACITY OUTPUT OF STEEL FOR MANY MONTHS TO COME

Special to CANADIAN MACHINERY.

PITTSBURGH, Dec. 4.—The iron and steel industry is in the midst of troubles, not being entirely out of its own strike while the coal strike threatens to curtail its operations. There has been scarcely any coal delivered to the steel mills since the coal strike started Nov. 1, most of the coal consigned to mills being held up by the fuel distributing authorities. Mills have been able to get along fairly well with their stocks, but these are now largely depleted. On top of this situation, making it uncertain whether there will be enough coal to enable all mills to continue to operate, comes the danger that the production of coke will be restricted in order to release coal for the most urgent uses. Curtailment in coke production would decrease the make of pig iron, of course, while in addition it would interfere with operation of plants that depend upon blast furnace gas for their power.

Strong hopes are entertained that the coal strike will be broken by the strenuous measures adopted by the Government upon refusal of the miners' officials to accept the 14 per cent. wage advance proposed by Dr. Harry A. Garfield, Fuel Administrator. The Pittsburgh Coal Co., by far the largest coal interest in Western Pennsylvania, promptly announced that it would co-operate with the Government and endeavor to operate its mines. If the strike is ended in this way it will be a victory for the Government and the people, not for either the operators or the miners. The operators had expected to pass to the public any additional cost they might incur through a wage increase, perhaps with an addition on the side, whereas Dr. Garfield prescribes that the 14 per cent. advance is to be absorbed by the operators, with no increase in coal prices.

The Iron and Steel Strike

The iron and steel strike, described in last report as "crumbling," has gone entirely to pieces in Mahoning valley. Men have stampeded back to work, and at the plant that was slowest in resuming during the past few weeks applicants for jobs in some departments are being turned away, as the departments are already fully manned. The entire productive capacity of the valley is not yet in operation, but work is being resumed as rapidly as possible.

In the Wheeling district the strike still hangs on, but there is likely to be a stampede there within a week or two, since the strikers have at last learned that newspaper reports are correct to the effect that various other districts have been working.

There is no disorder anywhere, and except perhaps for the Wheeling district there is no intimidation. Thus, in the main, the men remaining out of employment are actual strikers, whereas early in the strike many men were idle because of intimidation. Taking the industry as a whole the men idle now amount to between 10 and 15 per cent. as many as the maximum number idle when the strike was at its height, in the first week. How many men are in employment is another matter, for there have been gains by some new men coming into the industry and losses by some men drifting away, a few thousand having gone back to the lands of their birth. Before the strike the industry was not fully manned.

The important thing now is not how much of the strike is left, but how well the works can operate, and that depends as much upon morale and efficiency as upon the actual number of workers. The morale, of course, is low at many works, the men knowing that as an aid to breaking the strike the employers were glad to have them in employment on any terms, even if they did not do much work. As to efficiency, there are some new men who must be trained from nothing, and there are many men who have shifted employment and must be trained in their new jobs. Even that is not all, as when the strike is recognized as entirely over many of these men may drift back to their old jobs and thus cause fresh confusion.

Production Prospects

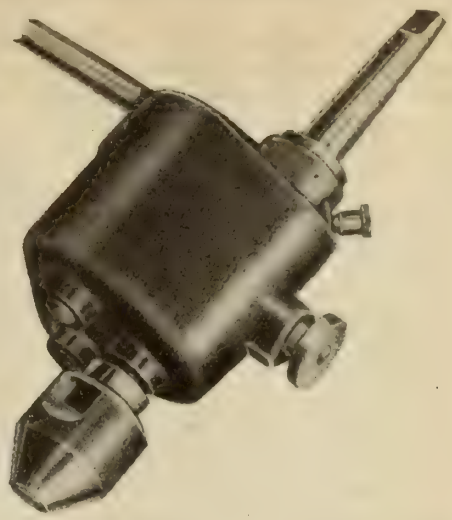
Altogether the prospects are clear that there will be nothing like capacity production for months to come, if at any time in the discernible future. Last January production of steel was at about 90 per cent. of capacity, figuring capacity on a conservatively low basis. The subsequent slump carried the rate down to about 50 per cent. the middle of May, and with continued recovery thereafter the rate just before the strike was about 85 per cent. For a few days the strike cut this in half, making a rate a trifle under 45 per cent. Now the rate is about four-fifths of that just before the strike, a trifle under 70 per cent., and the 85 per cent. rate may not be reached before next March.

In our report for the issue of Oct. 30 it was estimated that even if the strike should recede rapidly thereafter it would, all told, cause a loss in production of more than 2,500,000 gross tons of fin-

Aikenhead's

Wahlstrom Attachment

offers you the advantage of hand tapping plus drill press speed



The oscillating movement mechanically imitates hand-tapping, though 10 times faster, and reduces tap breakage to the very minimum.

AND THE WAHLSTROM ATTACHMENT IS ACCURATE. It taps holes as squarely as they could be drilled. Takes taps of all sizes up to ½ inch. **Sent on trial. Money refunded if you are not satisfied.** Write for bulletin.

Attached to any Drill Press will quickly Pay its Cost

Powerful Durable Trouble-proof

AIKENHEAD HARDWARE LIMITED

17, 19, 21 Temperance Street - - Toronto, Canada

Glue has the Greatest Sticking Strength when maintained at a temperature of 145 to 150 degrees Fahr.

It's easy to maintain this heat with "International" Electric Glue Heaters. They operate on dry heat, utilizing every bit of heat generated because conserving it on the fireless cooker principle. There is no evaporation of water or glue—therefore no waste. There are no burn-outs from evaporation of the bath because no water is used in these heaters. More of the glue is wasted because the electric dry heat principle prevents the formation of skin, scum or dirt on the glue.

Aikenhead's Electric Glue Heaters

For Woodworking and Pattern Shops

Cost of operation is but a trifle. Less current than an electric flat iron consumes is ample to operate 13 one-quart Electric Glue Heaters.

May we send our latest Bulletin?

AIKENHEAD HARDWARE LIMITED

17 TEMPERANCE STREET, TORONTO

If interested tear out this page and place with letters to be answered.

ished rolled steel, since after the strike the full pre-strike rate of production, which was about 2,500,000 tons a month, would not immediately be restored. A fair estimate to-day is a loss of 3,000,000 tons, this including allowances for deficiency in production in January and February, and no one can be certain that production will be going along smoothly even next March.

In these circumstances it is not surprising that steel consumers are seeking eagerly to cover their requirements for the fore part of next year, and that the manufacturers who do not as a matter of policy adhere to March 21 prices are asking advances for such material as they have to offer. The Steel Corporation pursues rigidly its price maintenance policy, but cannot in all cases supply even its regular customers fully. The independent tin plate mills are practically a unit in going along with the Steel Corporation in maintaining the regular $7.00 price, but less than half the independent sheet manufacturers are showing the same spirit as to sheet prices.

Pig Iron

The rise in pig iron continues. While some furnace interests a few weeks ago were professing themselves as anxious to see the market held on an even keel, they did not commit themselves by selling ahead at old prices and the forces in favor of advancing prices have had full sway. The Philadelphia market has advanced again, being now $37.60 delivered Philadelphia for No. 2X, while Buffalo and Cleveland have also advanced. In the Pittsburgh valley market a wide range of prices has obtained, according to tonnage and delivery. A small lot of malleable has sold at $35.25, valley and foundry has brought $35, valley for December. The top price on Bessemer has been $36 valley done on 100 tons for December, while a valley furnace sold Bessemer at $32 and then at $33, a detached Western Pennsylvania interest afterwards securing $34, delivery December to March inclusive, equal to $35.10, delivered Pittsburgh. Outside of fancy prices paid for small prompt lots the valley market is quotable at about $32 for basic, $33 to $34 for Bessemer, and $33 to $35 for foundry. The furnaces have been talking higher costs, and also claiming that they have made no money of late, even during the latter part of the war..

According to present appearances, Lake Superior iron ore will not be higher for the new season, but Connellsville coke will be much higher. The average cost in the past few months has been $4.25 per net ton at ovens, but the average is likely to be $6.00 and higher for the first half of next year. For a particularly good brand of coke some contracts have just been made at a ratio of 5 to 1 on basic pig iron, valley, which at the present $32 market would mean $6.40 for the coke.

CANADIAN FIRMS HAVE SEVERAL INQUIRIES IN THE MACHINERY MARKET

Special to CANADIAN MACHINERY.

NEW York, Dec. 4.—Canadian companies are inquiring for machine tools in New York. One such inquiry is from the Canadian Ingersoll-Rand Co., Ltd., Sherbrooke, Quebec, and asks for quotations on one 10 x 20 ft. planer, one 16 x 24 ft. vertical extension boring mill, one 7 ft. radial drill, and one floor-type boring mill with 6 in. spindle. The Fraser, Brace Shipyards. Ltd., 83 Craig Street West, Montreal, Quebec, is inquiring for the following equipment: One oil-heated angle iron furnace, one plate bending roll, two vertical punching machines, six plate punching tables, two single-headed shears. one horizontal punching machine, three radial countersinking machines. one angle iron cutting machine and an emery wheel.

The American Locomotive Co. will buy from its New York office a considerable quantity of new equipment for its Montreal works, where foreign orders for locomotives will be executed.

Business in machine tools is booming in the East. Not since the war has there been such a large volume of buying. The automotive industries are the principal purchasers. The New Departure Mfg. Co., Bristol, Conn., a subsidiary of the General Motors Corporation, has placed orders for 400 to 500 tools, totalling its value close to $1,000,000. The company's output of ball bearings will be greatly increased. The Willys Corporation, Elizabeth, N.J., which will put a new light six cylinder automobile on the market, has bought about $500,000 worth of tools, mostly special machines. The H. H. Franklin Mfg. Co., Syracuse, N.Y., is in the market for equipment for a plant addition.

Among other companies which are buying or inquiring for tools are the General Electric Co., Western Electric Co., Worthington Pump & Machinery Corporation, C. H. Johannson, Inc., Poughkeepsie, N.Y.; American Car & Foundry Co., Liberty Starters Co., Poughkeepsie, N.Y.; and the Eastern shipyards are inquiring and buying a few new tools.

The Standard Oil Co. of New Jersey has bought about $150,000 worth of tools and plate-working machines for shipment to Roumania. This is the largest export order placed in some time.

Deliveries on machine tools are getting further off. One Eastern company is sold up until the end of 1920 on a line of automatic machines. An Eastern lathe builder received orders last week for upwards of 100 lathes. Many tool builders have orders on their books for three to six months. Prices are recording no important changes, and sellers predict that there will be no further advances unless costs of labor and material should go considerably higher.

U.S. SCRAP METAL

While there are many instances of advances in scrap material, in some districts the coal strike has knocked the bottom out of the market. Following are reports from United States districts:

CHICAGO.—While there is decreased buying by some interest due to the coal situation, others are keeping up their buying. This is particularly the case with rerolling mills, which although closed down, are still buying all the rails they can obtain. Cast scrap is active, and prices higher.

NEW YORK.—Most grades have shown an advance in price, those remaining stationary being heavy cast and machinery cast. Heavy melting is standing at $18 f.o.b. New York. Dealers seem to be holding back for further advances.

PHILADELPHIA.—There has been a general advance in scrap prices, and dealers are holding for still more advances. A lot of Eastern steel was sold at $24 delivered, Pittsburgh. Heavy melting is quoted at $21 to $22 delivered, but probably would be hard to get at this price.

PITTSBURGH.—Advances in this district are pretty sharp, with a good demand. A large lot of heavy melting steel is reported to have changed hands at $25.75 delivered at Massillon, O. Heavy machinery scrap has brought $29 delivered.

CLEVELAND.—A sale of heavy melting steel of 10,000 to 15,000 tons at $23 delivered is reported. There is a good demand for most grades, and the market is firmer. Dealers look forward to better prices for 1920. Malleable is around $26.

CINCINNATI.—Coal strike and car shortage are having a bad effect on the scrap market, but there have been advances in some grades. No 1 machine cast and cast boring have advanced approximately $1 per ton, and heavy melting is keeping its level.

ST. LOUIS.—The possibility of being closed down due to the threatened coal strike has caused many consumers to stop their buying, resulting in a bad jar to the market. A large offering of various grades at lower prices found no buyers. Railroad offerings amount to only 875 tons and little material is coming in from the country.

BUFFALO.—There is a demand for heavy melting in excess of the available supply, and the price is going up. $22.-50 to $23 delivered is about the lowest quotation. Other grades are also in demand, with an upward trend.

BOSTON.—The scarcity of pig iron has caused consumers to look for more scrap, and this in turn is short. $30 for No. 1 machinery, the highest price since the armistice, reflects the condition. Availability of cars here has brought business from districts where the car shortage is acute.

Making Accuracy A Marketable Commodity

THERE'S a toolmaking shop in Detroit that refused to be stumped by any of the many problems our motor car builders present—the Michigan Tool Company.

This concern is fully equipped for any job—which means Dumore Grinders are there to do their bit.

In building jigs, standard bushings are used, the outer diameters running in an ascending series of sizes and calling for an arbitrary "constant" for the press-fit.

For grinding of this kind the Dumore is the ideal tool—high speed, dynamically balanced, non-vibrating, easy to move out of the way to permit the various holes to be indicated.

Write for information.

Labor Paper Says Steel Strike Has Failed

But There Has Been a Tremendous Loss in the Struggle—The Failure of the Radicals Has Cost $280,000,000—More Labor-Saving Machinery Brought Out

PITTSBURGH. — Authentic reports from the Pittsburgh district on conditions resulting from the steel strike called Sept. 22, ten weeks ago, show that the strike has been a distinct failure and that the steel companies for the most part now are contending simply with the imperfect shop organization inevitably accompanying operation with a large percentage of men not yet familiar with their jobs. This difficulty obviously is becoming less serious each day. Of the 228,430 mill workers employed in this the steel centre of Americea, 162,474 either failed to report for work or were sent home the first day of the strike. Out of this latter number 109,455 are back at work.

During the ten weeks of the strike, seven lives were lost, one man was paralyzed as a result of being struck on the head with a brick, and 173 were injured in riots, street fights or clashes between pickets and workmen and guards.

A conservative estimate places the total payroll loss in the entire district at $29,634,064.67, and property loss at $153,150. The only figures obtainable as to the tonnage loss by the steel company are those given by the strike committee, which places it at $250,000,000.

Not 1 Per Cent. of Strikers Idle

It is estimated less than 1 per cent. of the men who struck are idle to-day. Most of them have returned to their old jobs. Others have gone elsewhere to work. Many foreign workers have returned to their native land.

As a result of the strike, the labor situation is more serious in this district than it was during the war. Workmen going back to Europe, or leaving this region to find employment elsewhere, have created a shortage of almost 30,000 common laborers. The longshoremen's strike in New York has served to prevent many mill workers from returning to Europe, and as soon as that difficulty is settled a rush to Europe is expected.

Steel officials say the problem of insufficient laborers is being met in various ways. Many negroes, Greeks and Mexicans have been brought into the district since the strike. Significant are reports showing that the strike has stimulated inventiveness in the management of steel plants, with the result that new methods were devised whereby fewer men than formerly are required to perform certain work. These labor-saving methods will continue to be used.

Labor scarcity does not exist in all steel towns, for some mills have more applications than they have jobs.

Many independent steel plants throughout the district were compelled to shut down because of the crane operators and electrical workers being called out on strike, thus making it impossible for other parts of the plant to continue operations. In the course of a week the places of most of the strikers were fillled. Some of the crane operators now are receiving as high as $225 monthly.

Difficulties Are Surmounted

At the Clairton Steel Works, where clashes of strikers and State police caused much excitement, 500 laborers walked out September 22, in response to the strike order. These men were an important cog in a vast machine, and their absence necessitated a shutdown of the works, employing 4,300 men. A new organization had to be effected. For weeks the plant ran far below capacity, but new departments were added from time to time until now the plant is running 100 per cent., not only in the steel works, but in the by-product plant. The experience of the Clairton Works is typical.

In the Clairton by-products plant, an average of one car of coke is made every six minutes throughout the twenty-four hours of the day. This plant supplies coke for the Clairton, Homestead, Braddock and Duquesne works, and also provides much of the gas used in these plants. The gas is a byproduct in the transformation of coal into coke,

From the beginning of the strike, it was evident to steel officials and others that a large percentage of the strikers were not idle from choice. Prior to the actual calling of the strike, there was no question but that the sentiment in favor of striking was overwhelming. Many of the workmen were agitators of the I.W.W. type. Hundreds of others, vaguely feeling themselves victims of an unfair economic system, were easy prey for these agitators. Still other hundreds were of the kind that always may be depended upon to "go with the crowd."

Many joined enthusiastically in the strike, not because they felt that they had a grievance, but because they expected it to be successful and to result in their being better off than before. All believed that the strike would be short.

Radicalism Killed Strike

Among the reasons for the collapse of the strike in this district, the radical character of its leadership and the failure to pay promptly promised strike benefits stand out prominently. The pamphlet on Syndicalism written by William Z. Foster, secretary-treasurer of the national strike committee, entered the limelight soon after the beginning of the strike, and it became a subject of general discussion, revealing the fact, for the first time, to thousands of strikers and their sympathizers the kind of man who was managing the gigantic walkout. With this realization there grew rapidiy among the striking workmen a conviction that they had allowed themselves to be used as "tools."

During October the American Sheet and Tin Plate Company of Vandergrift, which was closed by the strike, had the largest production in the history of the company.

The Wheeling district is the only one idle to-day. However, steel company officials say the backbone of the strike has been broken, as the hot mill men of the Laughlin plant of the American Sheet and Tin Plate Company in Martins Ferry and the La Belle plant of the same company in Wheeling, as well as the Aetna Standard in Bridgeport, have voted to return to work. All three of these plants own and operate their own coal mines, and until the coal situation is adjusted, there can be no resumption of operations in any of the big mills. The men of the Riverside plant of the National Tube Company in Benwood have voted to return to work, but no definite steps for a resumption have been taken by the company.

In Wheeling, the union commissary will supply more than 600 needy families of union strikers with foodstuffs during the week. Three weeks ago, the steel workmen's organization began disposing of food. At that time there were only 125 families. In two weeks the number jumped almost to 500, and it is expected that the number will double weekly until the strikers return to work.

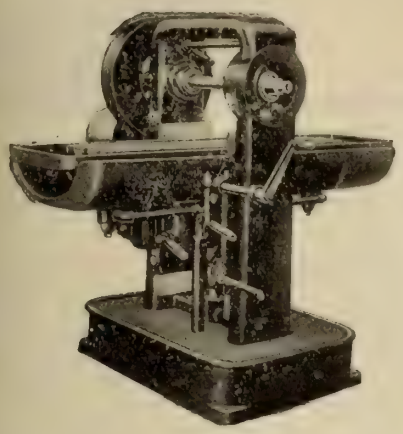
The commissary was installed in Youngstown instead of the promised financial benefits. Whenever this commissary is open, there are many women and children standing in line awaiting their turn to be served.

In its current issue, the West Virginia Labor News admits that the steel strike has collapsed, and admits the full resumption of operations at various plants, following agreement by the strikers to abandon their officials and return to work on the open shop basis. The News has been backing the steel workers in their strike.

The death is announced at his home in Haileybury of Mr. J. W. Moffet. The deceased was well known in the mining district, having erected mills at the Penn-Canadian, Silver Cliff, and Beaver Mines in Cobalt, and the Kirkland Lake mines. Death was due to tuberculosis. Mr. Moffet was born in Missouri 74 years ago, and came to Cobalt in 1905. He is survived by a widow and one daughter.

BRIGGS MILLERS

"We Call It the Big Little Milling Machine"



And so it is. A man who is unfamiliar with the "Briggs" and the work of which it is capable is always surprised at the power available and the extreme rigidity on any milling operation which is within the range of this tool. It is a small machine; but the solid over-arm construction and the convenience of operation make it a manufacturing machine of unsurpassed production possibilities on all work which it can handle.

The low first cost of the Briggs Miller is another of its surprising features. The floor space required is small. Upkeep is slight. operating cost is low because skilled labor is not required to obtain the best output of which the machine is capable. And there are other advantages, too, which we'll be glad to explain in more detail.

We have several of these machines in Toronto warehouse

Garlock-Walker Machinery Company, Limited

32 Front Street West, Toronto, Canada

MONTREAL **TORONTO** **WINNIPEG**

The Week's Events in Montreal Industry

The Mason Regulator and Engineering Co., of Montreal, has secured the agency for the Republic Flow Meter.

Roderic J. McLean, engineer, of Montreal, has obtained the agency for the T. J. Wing Manufacturing Co., 352 West 13th Street, New York, manufacturers of engine and boiler room equipment.

An order recently received from the Norwegian Government by the Canadian Vickers Co., for a large steel cargo vessel, is the second this company has had from this source in the past few months. This vessel is to be delivered by the close of May, 1920.

At a recent meeting of the Montreal branch of the C.A.S.E., the subject was the reading and discussion of a paper on D.C. current and equipment, illustrated by a large number of slides. The evening was one of interest and instruction.

M. P. Fennell, secretary of the Montreal Harbor Commission, has been elected to the office of secretariat of the American Association of Port Authorities, and this office will now be transferred to this city. It is interesting to note that this is the first occasion that a Canadian has held this office.

A commercial club has recently been organized in the city of St. John, N.B., with an initial membership of nearly two hundred. S. E. Elkin, M.P., has been elected president, and with the assistance of an able executive the club proposes to arouse public sentiment and hasten action for the development of the city along modern lines.

The proposed plan to connect the Great Lakes with the sea by way of the St. Lawrence is again in the limelight. In addition to developing schemes for removing existing obstacles for deep water navigation on the river, the utilization of available hydro power is part of the present plan. The scheme would involve the overcoming of a fall of 220 feet in a distanec of one hundred miles above Montreal.

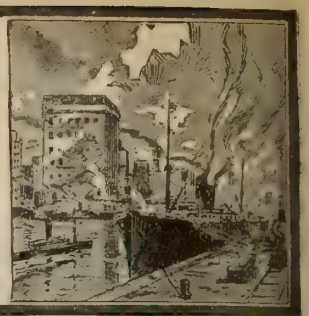
Edward F. Sise has resigned from the position of chief executive of the Northern Electric Company after a long period of successful administration. He organized the Wire and Cable Co. in 1899, and was managing-director of that company when it was amalgamated with the Northern Electric Co. The presidency of the company has been filled by Paul F. Sise, who will now assume the duties of this office.

At the invitation of J. J. York, A.E.I.C., the Montreal branch of the Engineering Institute of Canada visited the St. Lawrence Sugar Refinery on Friday evening and Saturday afternoon (Nov. 28 and 29). The parties were shown over the plant by Mr. York in person, the whole trip requiring fully three hours. Raw sugar is received at wharf, coming by boat from West Indies. The shed can hold a month's supply, the daily capacity being over a million pounds of sugar. The parties followed the refining process from the receiving shed to the final boiling to granulated white sugar, and automatic packing as granulated sugar or manufacture into cube sugar.

Two 25,000-kilowatt steam-driven turbine units of the American Westinghouse make, which, when installed, will complete the largest steam-driven electrical installation in the Far East, are now being erected at Osaka, Japan, for the Osaka Electric Light Company. With its power station situated in an extensive industrial district, this company furnishes light and power to street railways, steel works, shipbuilders, copper refining plants, paper mills, electrochemical installations, and other industries. It may be mentiored that in 1908 the Osaka Company installed three steam turbine units of 3,000 kilowatts each. In 1910 two more units of like capacity were added, and in 1911 two 5,000-kilowatt units. The 25,000-kilowatt units now being installed will bring the capacity of the plant up to 100,000 horsepower.

INDUSTRIAL NEWS

NEW SHOPS, TENDERS AND CONTRACTS
PERSONAL AND TRADE NOTES



TRADE GOSSIP

Emergency Coal for Canada.—The handling of coal released to Canada by the United States administration has been arranged by the fuel section of the Canadian Trade Commission. Coal is expected to come across the border in the next few days. Hospitals and such public institutions will have the first attention, after which will come industries engaged in the manufacture of foodstuffs. There have been many applications to the board from industries wishing to be placed in the essential class, but the board referred these to the Provincial administration.

Coal Situation in Toronto.—If the strike continues in the United States for another ten days, 10 per cent. of the small industries in Toronto will be forced to close down. This is according to statement made by William McGill & Co., of this city. A further statement from the same source was to the effect that very little coal was coming into the city, and the coal obtained by the fuel controller was being devoted to the use of hospitals and public utilities. The large industries were in a better position, having, in most cases, enough coal to carry them through the winter.

Coal Commissioner for B.C.—W. G. Gaunce, of Victoria, has been appointed Controller of Export Licenses for British Columbia. Shipowners requiring bunkers for their vessels, if not registered in Canada, must get a license from the controller before they can obtain their requirements. Coal for export must also be licensed. There are only two kinds of licenses issued, the first for coal cargoes destined for U.S. and Alaska points, and the second for bunker coal for ships flying any flag and sailing for any destination, but only for sufficient quantity to take them to the foreign port.

Canadian Bridges Too Light.—Mr. Frank Barber, speaking before the Electrical Club recently in Toronto, expressed the opinion that most of the Canadian bridges were built too lightly. There were bridges in Europe that were older than the banks of the streams they were on. The life of a steel bridge was seldom more than fifty years, and the failure of this type of bridge was due to poor concrete abutments. The use of concrete would eventually supersede steel for bridges. The new bridge being built in Peterboro' would be erected with one hundred and fifty tons of steel and fifteen thousand yards of concrete.

THE F. F. BARBER MACHINERY CO. OPENS UP FOR BUSINESS IN TORONTO

ANNOUNCEMENT is made of the formation of the F. F. Barber Machinery Co., with offices on the fourth floor of the Foy Building, Front St. W., Toronto. Mr. Frank Barber, recently in charge of the machine tool department of the A. R. Williams Co., is at the head of the new company. "Our prime object," said Mr. Barber to CANADIAN MACHINERY, "is specialization. We propose to handle sufficent lines to cover

F. F. BARBER,
Pres. of F. F. Barber Machinery Co.

production equipment, as well as standard machine tool equipment. We propose to carry the leading lines of tools in each type. By doing this we feel that we can give both customers and makers a better class of service than has hitherto been possible." Mr. Barber is at present in the machine tool markets of United States, where he is completing arrangements for representing a number of machine tool lines in Canada.

Mr. Barber has been in the machinery business in various capacities for a number of years—the fact is he has never been away from the business in some form or another. His first experience came when he was "articled" to F. W. Hudlass at Southport, England, who founded and directed the Phoenix Motor Car Works, and was later appointed chief engineer for the Royal Automobile Club of Great Britain and Ireland. Being "articled" at that time meant among other things, putting up £50 to guarantee that the "article" would remain on the premises until his apprenticeship term had been fully served. Such things would not go in this land now, but they are relics of a stern school of technical training.

Coming to Canada late in 1903 Mr. Barber was for a short period with the Russell Motor Co., going shortly to the McLaughlin Engine Co. as a mechanic. The next move brought him to the tool room of Roden Bros., silversmiths, going from that firm to J. P. Cleal, where he had splendid scope to work on models and engage in the development of patents. Mr. Barber was finally in charge of the experimental work in this shop, many intricate devices and improvements resulting from the adaption of his drawings.

It was in the year 1911 that Mr. Barber left the practical side of the business, going to the Fairbanks-Morse Co., sales department. He took kindly to the change and the change took kindly to him. In the early part of 1915, when the equipping of war shops was becoming an acute and urgent problem in Canada, as well as in every country under the sun, Mr. Barber joined the A. R. Williams Machinery Co. in the machine tool department. In common with dealers who went through the avalanche of business that threatened to bury and swamp the trade, Mr. Barber was able to render splendid service to the munitions shops, as well as gain a tremendous amount of valuable knowledge on shop equipment, special machines for special operations, etc.

Sault Ste. Marie.—Five bodies of the crew of the ill-fated Myron have been picked up above Salt Point in Whitefish Bay. This is after nearly a week's patrol of the north and south shores of Lake Superior and Whitefish Bay. No word of their identity has been received as yet. The body of Albert Neilson, deckhand of the steamer Townsend, was found near the centre pier. He fell in the canal some weeks ago while assisting to moor the vessel.

Secord Gets Contract.—P. H. Secord & Co. have secured the contract for the four-storey building for the William Paterson Sons & Co. in Brantford.

Victoria, B.C.—The Marine Department are considering the building of two 75-foot motor boats to supplement its present British Columbia fleet. The work of drawing up the plans has been entrusted to the Cholberg Shipyards.

Port Arthur.—Mr. J. H. Smith will be the new manager of the Port Arthur Shipbuilding Company, replacing Mr. J. F. Paige. Mr. Smith has not yet arrived in Port Arthur, he being detained in Cleveland owing to the illness of a brother.

First Oil Locomotive.—The first French locomotive to generate steam by the use of oil fuel has been tried out successfully, a heavy train being hauled without difficulty. It is understood that following this trial two hundred locomotives will be equipped to burn oil instead of coal.

Board of Commerce to Act. — The Board of Commerce has given public notice that any complaints re high prices charged for bituminous coal, will be at once investigated. If the charge is proved, the Board will take steps to secure a conviction.

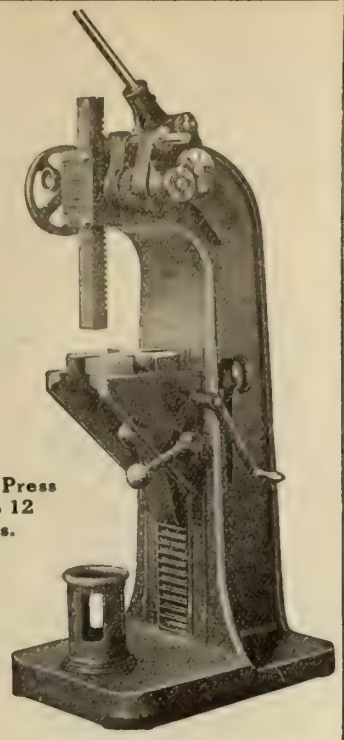
Coal Allowance Arrives.—The allowance of 150 carloads of bituminous coal daily, which was arranged for by the U. S. Fuel Administrator, started Dec. 1. The greater part of the first few days will be allotted to public utilities in various parts of Ontario.

To Build Bridge Approach.—The lines leading to the projected C.P.R. bridge over the Niagara River will be built by the Toronto, Hamilton & Buffalo Railway Co. The line will be from Welland to a point on the river six miles below Bridgeburg, where the bridge will be built.

British Trade for Canada.—Canadian manufacturers wishing to tender on business for British Government Department, will be sure of receiving the greatest consideration. The Admiralty, War Office, Ministry of Munitions, India Office and Crown Agents for all the colonies have signified their intention of considering Canadian offers for supplies purchased by them.

Baldwin's to Start Building.—It is understood that Baldwin's, Ltd., who have taken over the plant of the British Forgings at Ashbridge Bay, Toronto, will start the erection of two buildings immediately. Thes buildings are to be of considerable dimensions, one 800 feet long and the other 400. Other large buildings are being delayed owing to the shortage of structural steel.

To Take 50 Per Cent. of Space.—The British Ministry of Shipping, according to a report current in shipping circles, will requisition 50 per cent. of the cargo space of steamers sailing during the month of December. This is an increase of 15 per cent. over the requirements for November. The increase is probably due to the necessity of getting the grain moved over to England and Europe.



No. 4 Press 10 to 12 tons.

Write for complete information on Atlas Arbor Presses. All sizes for all purposes.

ATLAS PRESS CO.
330 N. Park St.
Kalamazoo, Mich., U.S.A.

British Columbia Lumber.—The exports of British Columbia lumber, excluding paper and wood pulp, during October amounted to 30,000,000 feet. Paper and wood pulp amounted to 20,500,000 pounds. 8,000,000 feet of lumber were shipped to Europe and the Orient and the remainder by rail to the United States. There is still a shortage of ships. South Africa is also in the market for B.C. lumber.

Terminals for Sydney, C.B.—In response to a visit of a deputation some time ago to Ottawa, an engineer has arrived here to look over the site for a terminal. A tentative selection has been made at Anderson's Point, and Parliament has voted $100,000 for the building of the wharf and terminal. Mr. Coutlee, the Government engineer, has also been visiting Glace Bay to look over some projected harbor improvements.

Ottawa.—The Canadian Government Merchant Marine will number twenty-three vessels before the end of the year, according to a statement by Mr. Alec Johnson, the Deputy Ministr of Marine. The "Canadian Spinner," "Canadian Planter," "Canadian Settler," "Canadian Rancher." "Canadian Railer" and "Canadian Traveller" will be all delivered before December 31st. The "Canadian Navigator" has been handed over.

Control of Big Fleet.—An agreement has been made with the British Admiralty which definitely places control of the International Mercantile Marine Co. in the hands of the English directors. This agreement states that the company shall make it compulsory that Englishmen manage the ships, and that the directors shall be subjects and residents of the British Empire. The names of new directors must be submitted to the British Government for approval.

Employment Managers Organize.—The employment managers of Toronto met recently in the Social Service Building of Toronto University, and formed the Employment Managers' Association of Toronto. A proposed draft of the by-laws and constitution of the Association was put before the members, and was adopted with few amendments. The next general meeting will be held on Dec. 8th, and the election of officers will be held.

Increase for Expressmen.—The Canadian Express Company's employees demand for a new wage schedule has been met by a compromise offer. This includes an agreement on the two weeks' vacation question, and a general increase in wages. By this arrangement men receiving less than $100 per month would receive a 15 per cent. increase; those getting from $100 to $110 a 12 per cent. increase, and all getting over $110 an increase of 10 per cent. This will be accepted by the men.

SAYS THE MASTER MECHANIC: The Greb Automatic Grip Puller is a One-Man Puller—Quick-acting, strong and simple in the extreme. May be locked in any desired position. A combination of two or three arms. Heavy Duty Size capacity 1" to 18"—Junior size capacity 1" to 7". Two sets of jaws furnished with each size.

TEN DAYS' TRIAL.—If your dealer or jobber does not have them we will send you one. Try it ten days. If not satisfactory, return to us and we will refund your money. We also make the GREB RIM TOOL.

THE GREB CO., 318 State St., BOSTON

An arrangement has been made by Mr. McGrath, Canadian Fuel Commissioner, by which an allotment of bituminous coal will be available to Canada. The procedure necessary in obtaining a supply is as follows: Preferred industries in Canada must have their applications substantiated by C. A. Magrath, Ottawa, after which the applications will be forwarded to the Canadian War Mission at Washington and by the Mission to the Central Fuel Committee.

Pig Iron Production.—The growth of pig iron production in the United States has been remarkable in the last few years. According to the National Bank of Commerce the United States now produces half of the pig iron output of the world. The output has grown from 14,000,000 tons in 1913 to 39,000,000 tons in 1918. The annual production of pig iron has a greater value than any other single manufactured product in the country, or of all the rest of the metals produced.

Fort William.—The "E. D. Kingsley," built by the Canadian Car & Foundry Co. here, made a successful trial trip recently. The vessel, which is an oil burning freighter, developed a speed of 13½ miles per hour on her trial trip. The Kingsley took on a cargo of 30,000 bushels of grain for Montreal after the completion of the trial, and after discharging this cargo in Montreal, will go in the West India trade for two or three months. She will then proceed to Vancouver by the Panama Canal.

Leaside Munition Plant.—An effort is being made to preserve the buildings at Leaside belonging to the American Munitions Board, and Colonel Stuart of the U. S. War Department has been conferring with Mayor Church on the matter. Colonel Stuart stated that the U. S. War Board would rather sell the buildings than tear them down, but so far had been unable to find a purchaser. As the ground lease runs for only a short period the buildings will have to be removed before the lease expires unless they can be sold.

To Open St. Lawrence Navigation.—The experts for the Dominion and United States Governments who are examining the Rivers St. Lawrence and Ottawa, for purpose of submitting report to the International Joint Commission, have got their report ready. It is now in the hands of the Joint Committee for consideration, and meetings will be held soon of all the interested parties on both sides of the St. Lawrence, with a view to action being taken to make the upper reaches of the river and the Great Lakes accessible to ocean-going ships.

Exhibition of Canadian Industries.—The Canadian Manufacturers' Association has circulated its membership on the subject of being represented at the Canadian Industries Exhibition, to be held in the Royal Agricultural Hall, London, England, from June 3rd to June 17th next. Mr. Lloyd Harris, who is now in Canada, supports the movement strongly, as one holding great possibilities for Canadian foreign trade. Mr. H. Greville Montgomery, who has offices in Toronto, will allot space and transportation and attend to the details for Canadian exhibitors.

Moulders Are Out.—In accordance with the terms of their ultimatum to the management two days ago, the moulders and coremakers employed by the Dominion Iron and Steel Company, at Sydney, together with the apprentices in the company's foundry, quit work. Forty-one men are concerned. The men's demand is for a wage increase which the company has claimed cannot be made at this time of unsettled conditions in the steel trade. International headquarters of the moulders' union instructed the men to negotiate further, and this was followed by the men's notice to the company that unless the demands were met in forty-eight hours they would go out.

Changes in C.F.M. Staff.—W. J. Legge has been appointed manager of the machine tool department of the Canadian Fairbanks-Morse Co. at Montreal. He was formerly in the machine tool department at Toronto. The small tool and supply department of the Toronto branch of the Fairbanks-Morse has been organized apart from the machine tool department, and is in charge of P. E. Thring, who has recently returned from service overseas. E. E. Turner, of the machine tool department of the C.F.M., Montreal, has left for various plants in United States, where he will remain studying special production problems for the next three months. It is the intention to have Mr. Turner doing development and investigation work in Canadian shops where production on a quantity basis is possible.

MARINE

Fort William.—The grain rate for December loading will be five and possibly six cents, instead of three and a half cents prevailing in November. Regular marine insurance ceases at 1 o'clock November 30.

Cleveland.—Latest news of the Tioga, ashore near Calumet, is that she is pounding to pieces. She has been abandoned by her owners to the underwriters as a total loss. The crew left her the day after she stranded. Her wheat, valued at $250,000.

Port Huron. — The liner Hamonic, which was in the river here on Saturday, cast off and went out into the lake during the heavy gale. Her captain preferred to be clear of the narrow waters, where he had no room to manoeuvre, and feared being blown aground and damaged.

Calumet, Mich.—The steamer Tioga of Superior is hard aground three miles east of Eagle River, and leaking badly. She was driven ashore in a heavy snow storm, and with the heavy northwest wind that was blowing at the time, she was in danger of breaking up. Last reports give eight feet of water in her hold.

Fort William.—Tugs are busy keeping the harbor open until the close of navigation. The steel tugs Strathmore and Strathbell have been working for some days breaking the ice as it forms, and the tug E. C. Whalen is being brought along to assist them now the weather is colder. If necessary, the Grant will also be employed.

WORST STORM SINCE 1913 BLOW

The Westmount Battles Through and Runs Into an 80-Mile Gale

Fort William.—Capt. Davis, of the Canadian steamer "Westmount," which left Sault Ste. Marie for Fort William Saturday, passed through what he described as the worst storm since the great blow of November, 1913. The Westmount arrived in Fort William early in the morning.

According to Capt. Davis, the barometer dropped to 7.8, and just off Caribou Island he ran into an 80-mile N.E. gale, with blinding snow. Frost from water made vision impossible for more than a ship's length. The thermometer registered 20 degrees below zero, and the spray froze as it touched the decks and rigging. The Westmount was sheathed in ice in a few minutes. Tons of ice were shipped from the decks on arrival here.

Capt. Davis reported Slat Island Light extinguished.

CANADIAN PIG IS SELLING IN U.S.

Looks as Though There Might be a Runaway as Far as Prices are Concerned

New York Dec. 4.—Some symptoms of a runaway market in pig iron have appeared, but as the main pressure is for early delivery and the supply of such iron is not large, the scramble has been limited. In next year's iron there is not yet the general buying nor the general willingness to sell that combine to produce a broad movement.

In basic iron a sale of 15,000 tons to a plate manufacturer is reported at Philadelphia at $31.25, delivered, and sales of 10,000 tons in the Pittsburgh district were at $30 at furnace. No. 2 foundry has sold in the Central West in considerable lots at $32 at furnace for the first half. One Alabama seller opened its books for 1920, but after selling 23,000 tons at $31 at furnace, an advance of $2, withdrew from the market. Heavy inquiries have come up in central territory particularly from the Detroit district.

The sales of Canadian pig iron to melters in the United States have been considerable. Shipments from the Soo furnaces in Ontario, together with recent sales, make a total of 45,000 tons to the Chicago district, besides 15,000 tons for the Pacific coast. The Port Colborne, Ont., furnace has also made sizeable shipments to this side.

Estimates that the railroads will buy 1,000,000 tons of rails when they are turned back are considered conservative in view of tentative inquiries by the Pennsylvania and New York Central Lines. In the Chicago district pending inquiries amount to 250,000 tons. The Algoma mill has an order for 80,000 tons for the Canadian Pacific. In view of the car and motive power scarcity that is already menacing winter distribution of fuel and steel, figures for next year's needs exceeding 200,000 for cars and 5,000 for locomotives are not considered excessive.

DISPUTE OVER PLANT VENTILATION

Echo of Some of the Processes Used In the Making of Munitions

Ottawa.—The first case heard in the Supreme Court was Scotland vs. Canadian Cartridge Company. The appellant was employed in respondent's munition factory at making brass shells for cartridges, part of his duty being to dip the shells in baths of sulphuric acid and cyanide of potassium. After four months of employment he was taken ill and the doctors decided that inhalation of noxious gases was the cause. He brought an action for damages, basing it on the ground that defendants had not complied with the provisions of the Factory Act in the ventilation of the room in which he worked.

The jury found the defendants negligent as to ventilation, and a verdict was entered against them for $3,500.

The Appellate Division set it aside and dismissed the action, holding that plaintiff had failed to prove negligence.

Judgment was reserved.

DESIGNING THE RAILWAY TRACK

Great Attention Must Be Given This Work to Secure Best Running Results

In a paper on "Railway Track Design and Manufacture," read at the meeting of the Montreal branch of the Engineering Institute of Canada, Mr. W. E. L. Dyer referred to track construction as a branch of engineering as important as that of location, especially in view of the very large amount of capital invested in roadbeds. He then traced the development of the different forms of rails, and of spikes, chairs, fish-plates, and angle-bars. Efforts, he said, had been made to eliminate joints, but without success. The lap joint initiated by the C.P.R. was being adopted by some of the American companies.

Crossing failures were sometimes due to faulty foundations, and he advocated the use of concrete foundations for crossings. It was not generally known how accurately intersections had to be calculated and designed; many of the larger intersections required a week for calculation, and after that they had to be designed. The hard steel frog was introduced into Canada by Mr. Blackwell, one of the presidents of the institute.

Mr. Dyer discussed in detail the use of solid manganese steel, which was more expensive as to first cost, but which had many points to recommend it as to use.

ORGANIZATION OF TOOL DEALERS SHOULD BE NATIONAL IN SCOPE

COMMENCING on an interview with one of the Toronto machine tool dealers in last week's "Canadian Machinery" to the effect that there should be an association of dealers in Toronto, another dealer stated this week: "I noticed what was said in the last issue of CANADIAN MACHINERY in regard to a local organization of machine tool dealers to deal with various selling problems. If such a thing were undertaken the best results would follow from an organization that would take in the whole Dominion. In such a body there could be divisions, with a centre at Toronto, another at Montreal, one at Winnipeg and another at the coast. In this way I believe something might be accomplished on a larger scale than just arranging differences in selling campaigns. I do not see any good reason why the makers of machinery and machine tools in this country could not have a membership in such an organization. It might help the makers and dealers to get together occasionally and have a better understanding of each other's problems."

Still another dealer, speaking of the matter, stated that some sort of an organization could be of advantage in keeping makers of machinery from playing one house against another. "Not so very long ago the representative of a certain firm came to my office," he stated, "and told us that they were not going to stand for the representation that a certain other house had been giving them. This gentleman intimated that he wanted to open up his line with us in this country. Now, I happened to know more of the facts of the case than the man did who was representing that firm. His representative had made a great number of calls for this line, and he had made them intelligently and persistently. I used to run across him time and again, no matter how often he had been turned down. That firm did not back up the house that was handling their line. To my knowledge they never assisted with the advertising, and never turned in and gave a hand to put their line in the Canadian market. The firm that had been making all these attempts was to be turned down flat and the line handed over to us. I refused. I told that representative that he had been well represented in this field, and that if the business were not forthcoming it was no fault of their representative."

Now, it seems to me that an association of machine tool dealers would be able to bring out all the facts with a case like that, and help all concerned. I do not mean for one minute that any central organization could dictate the policy of any firm. I know we would not stand for that, neither would any other firm that I know of. But apart from that, there are many matters that could be discussed to the mutual advantage of all concerned."

PLAN BRIDGE TO CROSS AT WINDSOR

Scheme Would Involve an Expenditure of $12,000,000—Plans Under Way

Detroit.—Under the leadership of Gustav L. Lindenthal, the eminent Swedish engineer, of New York, a movement is on foot to organize a corporation under the charter of the American and Canadian Governments for the purpose of constructing a $28,000,000 suspension bridge across the Detroit River, connecting Detroit and Windsor. The plans have been so far advanced that the proposition seems assured.

It is proposed to build a bridge supported from towers on either side of the river with double deck suspension, the span to be capable of handling railroad, street car, automobile and pedestrian traffic. There would be one span 110 feet from the water level, which would allow any of the Great Lakes carriers to pass through.

MUST GET RID OF COAL AT SYDNEY

Embargo Against Shipping Brings Up a Big Problem of Employment

Sydney, N.S.—What to do with the surplus coal of Cape Breton is a problem. The embargo on at present forbids coal going to foreign countries. With the closing of the St. Lawrence the large bunker trade which the Dominion Coal Company has enjoyed during the summer will be very greatly reduced. By the curtailment of this business the company will have a still larger surplus from its mines than it has at present.

If the mines of Cape Breton are to be given steady work throughout the winter there are only two ways in which this can be obtained, according to a prominent coal official, one is to remove the present embargo or have the companies obtain a market in Great Britain. At present Britain faces a very grave situation as regards coal supplies, and the heating problem is a very serious one.

There seems to be no reasonable grounds for curtailing the output of the Cape Breton mines, but unless local mines can find an outlet in Britain for the surplus output from their collieries, the companies will have to resort to banking in order to keep the mines working.

Shipping coal from Cape Breton to Great Britain would involve few, if any more, difficulties than shipping to Rotterdam. In spite of this, coal could be landed at a fair marketable price in Britain, freight rates would not be any higher than to Rotterdam and possibly a little lower. In such cases the difference would make up for the little extra time in discharging.

THE "WANT" AD.

The "want ad." has grown from a little used force in business life into one of the great necessities of the present day.

Business men nowadays turn to the "want ad." as a matter of course for a hundred small services.

The "want ad." gets work for workers and workers for work.

It gets clerks for employers and finds employers for clerks. It brings together buyer and seller, and enables them to do business though they may be thousands of miles apart.

The "want ad." is the great force in the small affairs and incidents of daily life.

One of the things we all do well is to forget.

Names that were household words yesterday are gone to-day.

Because people knew your Name and your Line a year ago it is no sign they do to-day. They forget easily.

Keep yourself in the public mind by advertising. It is just as important to make old friends remember as it is to win new friends. Advertising does both.

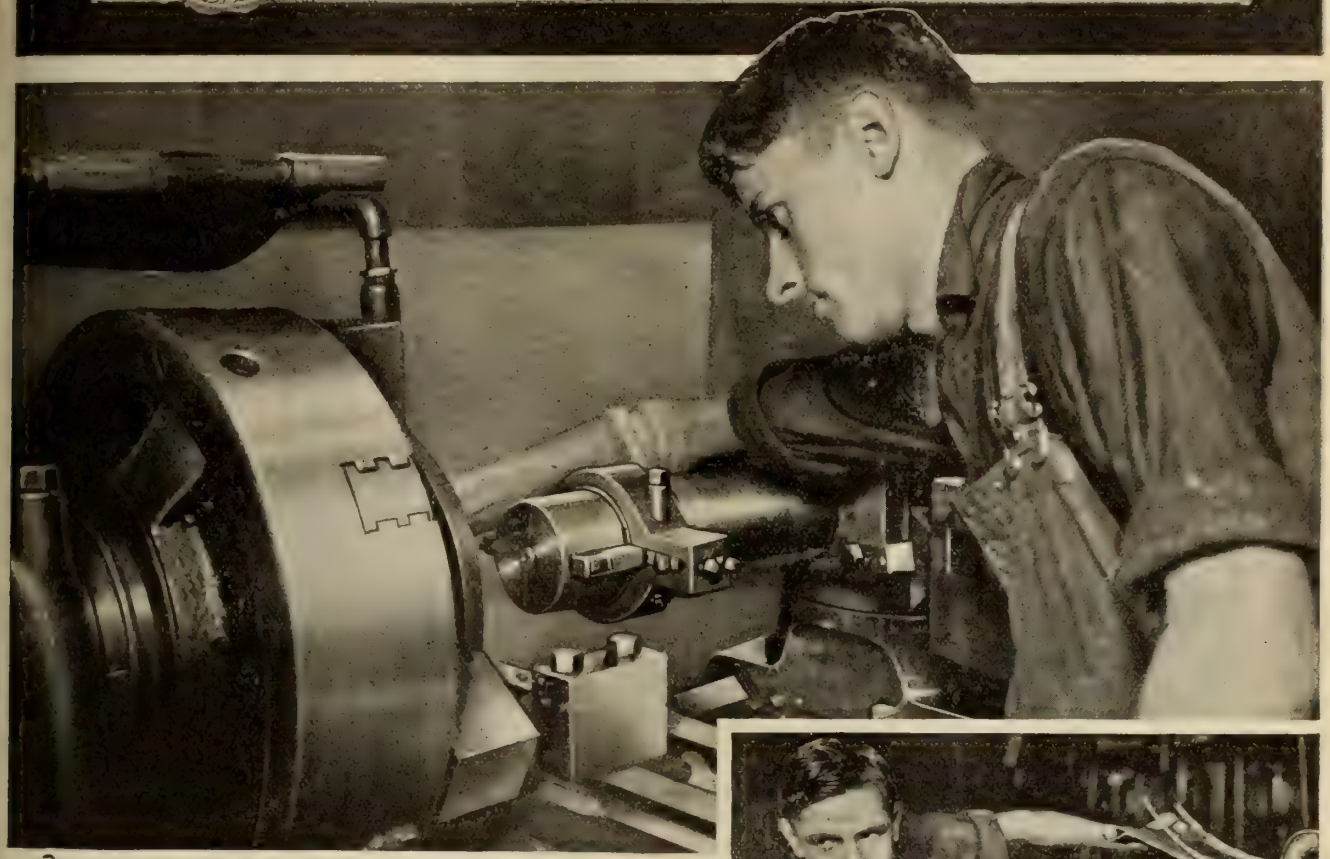
KELLY PRODUCTION TOOLS



KELLY REAMERS

Reduce Spoilage 99 Per Cent

A large New York State gear manufacturer had been using Kelly Reamers for only three weeks when he permitted us to take these photos. In that time they had reduced spoilage on large gear bores just 99 per cent.

Production was interesting also. One large Kelly Roughing Reamer was removing 7/16″ on the diameters of steel gears. It stood up over a period of five days and four nights, machining in all 4,950 gears without need of resharpening. The Kelly Finishing Reamer for the same job removed 0.020″ with a tolerance of plus or minus 0.001″, and stood up for a similar length of time.

This company is now using Kelly Reamers on practically all turning machines. And the Kelly Service Man is regularly on the job to see that these tools are giving all they were built for. **Write for Catalog J-3.**

Must School Teachers Starve?

By Sir Robert Falconer, President of the University of Toronto

CANADA is threatened with another epidemic—cheap teachers! A grave warning, showing the seriousness of the situation, has been made public, through the medium of MACLEAN'S MAGAZINE.

The financial attractions in commerce and trade are proving such a lure to the clever Normal School and University graduates that public schools, high schools and universities throughout the Dominion are being driven to engage inferior teachers—if they can get any at all! One teacher in Ontario is paid the princely sum of $300 per annum.

The article gives the opinions on this vital topic of such men as: Sir Robert Falconer; Principal R. Bruce Taylor, of Queen's; Dean of Arts W. Sherwood Fox, of Western University; A. P. S. Glassco, Secretary of McGill; President MacLean, of the University of Manitoba; President Klinck, of Canada's youngest university—British Columbia; President A. Stanley Mackenzie, of Dalhousie; and many others.

"The Thread of Flame"

By Basil King

This famous Canadian novelist has written a remarkable story that deals with a man who loses his identity while fighting in France. This strong novel, "The Thread of Flame," starts in the December issue of MACLEAN'S. This is the first occasion that a novel by Mr. King has appeared in any Canadian periodical prior to book publication.

Other Features of the December Number

"Merrie Gentlemen"—By Arthur Beverley Baxter.
You will think this the best Christmas story since Dickens' "A Christmas Carol."

"Capital and Labor"—By Ralph Connor.
One of a series of articles on "The New Canada and Its Needs."

"Ottawa is Ready for the Worst"—By J. K. Munro.
A humorous and pithy review of events at the Federal seat.

"Better Late Than Never"—By C. W. Stephens.
A bright Christmas story.

"Some Canadian Snobs"—By Montgomery Dix.
A humorous article on some phases of Canadian society.

"A Blighty Christmas"—By Gertrude Arnold.
An article on the way Yuletide was celebrated in a Red Cross Hospital.
And a dozen other articles and stories all of equal interest.

MACLEAN'S will be Twice-A-Month

starting February 1st, next year. An important point to remember. If you want to keep up with things **nationally Canadian,** you'll have to get the MACLEAN'S Twice-A-Month habit.

Over 350,000 Canadians Read

TRANCO TRUCKS

SAVE TIME

The Universal Elevating Truck

Made in Canada

Solves the Problem of High Cost of Labor

Labor is the big factor in costs. It was never so big a factor as it is to-day. This is true of trucking operations as in every other line of work.

In few other lines of work, however, can the situation be so effectively met as in trucking. This is made possible by the introduction of the elevating truck.

The TRANCO Universal Truck, for instance, can do the same amount of work that formerly took five men under the old stystem of trucking. High cost of labor thus is made almost negligible.

HOW THE TRANCO OPERATES: The load is piled on inexpensive platforms. Then the platforms are taken to their destination by means of TRANCO Trucks. Here the platforms are deposited and left until the material is disposed of. **The operation is simple and quick.** No time is wasted, and breakage, spoilage and other injury to material are reduced to practically nothing.

Ease of locomotion and operation is a big feature of the TRANCO. It operates with steering head and handle at any angle when lifting and lowering the load.

A double row of the famous Chapman Double Ball Bearings is used in the wheels. The swivel head is also equipped with these ball bearings. This makes the TRANCO Truck steer and roll much easier than a truck with other types of bearing.

We would like to explain more fully how the adaptability, simplicity and labor saving features of the TRANCO Truck can make a worth-while reduction in your costs of handling material. **Have us send you our attractively illustrated booklet.**

DOMINION CHUCKS

Especially Adapted for Severe and Heavy Duty Work

BODY—The body is of heavy cross section and so designed to give broad and deep bearings for the jaws.

JAWS—The jaws are drop forgings, heat treated. The jaw is so designed that the threaded portion makes 180° contact with the screw.

SCREWS—The screws are large in diameter, broached at both ends and are reversible.

Dominion Chucks can be furnished in crucible or cast iron bodies.

Holding a 5/16 x 2 in. Cut in Cast Iron on a Simmons Magnetic Chuck

Here is an example of the "grip" of a Simmons Chuck used on a No. 5 Brown & Sharpe Vertical Milling Machine.

On a piece of cast iron 16 in. x 2 in. x 1½ in. held by an 8 in. x 18 in. chuck, a cut 5-16 in. deep was made across the entire piece. The feed was 12½ in. per minute from the beginning of cut; the cutter was a 5 in. diameter inserted tooth face mill, running at a speed of 100 R.P.M. for the entire cut. Current used by the Chuck 0.4 amp. at 110 volt. *The strongest "grip," with the least current* —and no leakage of magnetism into frame of chuck or machine. It is powerful and yet it conserves electricity.

Bulletin 107E describes Simmons Magnetic Chucks

TAFT-PEIRCE

Woonsocket, R.I., U.S.A.

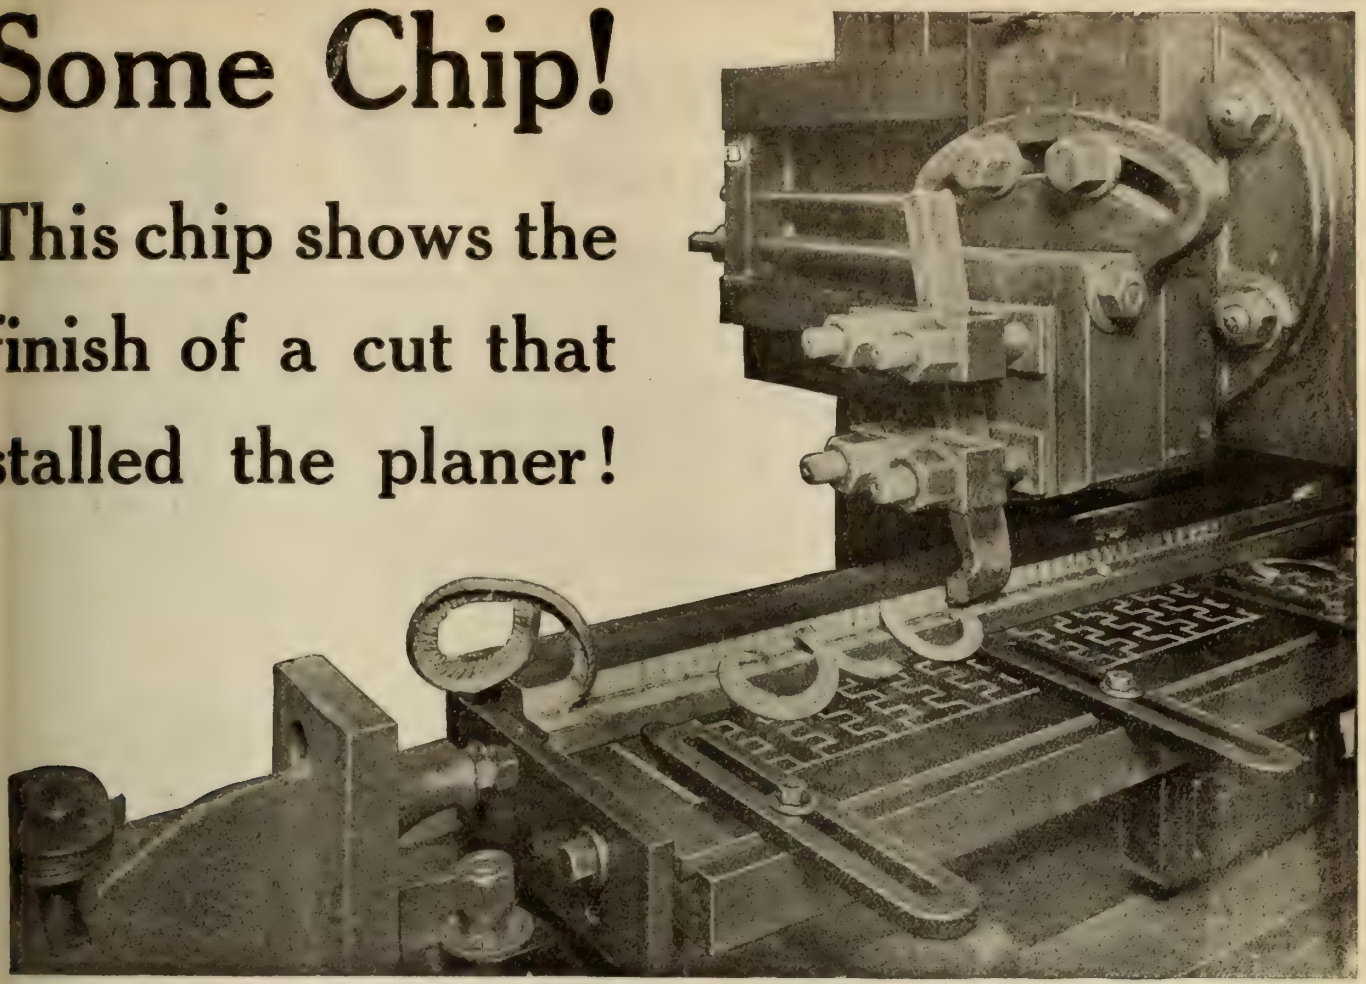
New York: Woolworth Building Detroit: Majestic Buildin

Williams & Wilson, Ltd., Montreal and Quebec

20

Some Chip!

This chip shows the finish of a cut that stalled the planer!



The cut was started at the far end of the piece and the work never budged. Some of the factors that contribute to the holding power and reliability of the SIMMONS UNIT-POLE MAGNETIC CHUCK are:

1—Effective utilization of the space on the face of the chuck;
2—Use of unit magnetic pole pieces of forged iron placed adjacent to each other with no neutral poles or neutral spaces between them;
3—Gaps between poles uniform throughout because adjacent edges are machined to definite dimensions;
4—Complete magnetic circuit insulated from the body of the chuck—a patented construction;
5—Machine wound coils assure uniform quality and equal ampere-turns in all;
6—Interlocking pole pieces offer transverse as well as longitudinal resistance to the work;
7—Watertight construction.

The Simmons Unit-pole magnetic chuck works where others fail, because it is designed in accordance with the principles of correct magnetic practice and gets the maximum pulling power that can be obtained in a given space. Ask for bulletin 107-E.

Details of Tests

The test here shown was made on a 30-inch Gray planer equipped with a 31 x 10¼-inch T-slot Simmons Unit-Pole Magnetic Chuck. The cut was taken on a cold rolled steel bar 31 inches long, 4 inches wide and ¾-inch thick. The chip was ⅝-inch deep and 3-16-inch thick. It stalled the machine.

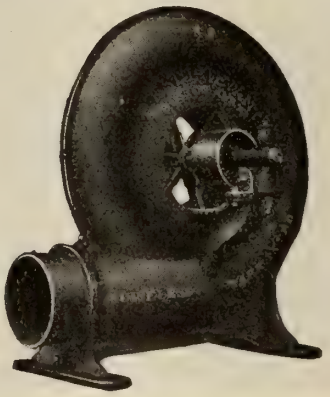
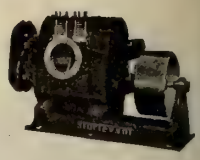
STEEL PRESSURE BLOWERS

Medium Pressure Blower



Low Pressure Blower



High Pressure Blower

For All Purposes

THO designed originally for supplying air to cupolas and forges Sturtevant steel pressure blowers are now used for all purposes where pressures up to 16 ounces to the square inch are to be maintained; and where air is to be forced for long distances. Regularly built with horizontal discharge but can be readily made for down blast or up blast. Built in all sizes and may be belt, motor, engine, or turbine driven. Operating and upkeep cost is remarkably low as proven by actual performance in many long term (30 years and more) installations. Design and construction are typically Sturtevant—supreme! Blast wheel is made of refined steel and galvanized to prevent rust. Wheels are accurately balanced and run smoothly when driven at high speed. Bearings are each cast in one piece and are lined with highly durable non-heating white metal. Write for catalogue.

CLINTON CEMENT

Did You Ever See Two Postage Stamps Stuck Back to Back?

Well, that's the way two bricks stick together when our cement is used.

The greatest loss in your furnace efficiency occurs as the result of leakage, cold air pouring in and interfering with proper combustion.

We Have Got This Licked!

Fireclay dries up and sifts out from between the bricks like powder.

But our cement sets and makes a surface like glass yet allowing for expansion and contraction. It sets hot or cold and stands a heat up to 3,000 degrees Fahrenheit.

This cement makes a joint that is stronger than the bricks themselves, and that is itself the strongest part of the whole furnace.

A five-pound tin of **Clinton Super-Heat Cement** will be sent to you free and all charges prepaid, if you write the

The foreman says.

"I suppose it's because I used them myself when I was at the bench, but it does seem as though the best men in the shop have a preference for Starrett Tools.

"Of course, most of them sort of got into the habit of relying on Starrett for fine work when they were apprentices and journeymen.

"Speaking of apprentices — that little red book there, 'The Starrett Book for Machinists' Apprentices,' has saved me more time and helped more young fellows to learn how to do things right than anything else in the shop.

"When a young lad asks me how to do this or that, I usually tell him or show him, and then ask him if he has one of those books. I've noticed that as soon as he gets one of them he doesn't have half so many questions to ask.

"Starrett gets out another book, 'The Machinists' Data Book,' that's just about as big a help to the experienced machinist. It's got all the tables and formulas and so on that he ever needs, and it isn't cluttered up with a lot of engineers' stuff that he doesn't use.

"Yes, I bought one of each of the books down at the hardware store, as soon as they came out. They cost me seventy-five cents each, but they're worth it."

C. G. E.
Fractional H.P. Motors

Every manufacturer who markets a motor-driven article should take into consideration that if the motor fails to give satisfaction, the whole machine will be condemned.

It is therefore obvious that the utmost care must be exercised in choosing the type of motor that will give maximum satisfaction with minimum attention, relative to the particular requirements of your product.

The C.G.E. Fractional H.P. Motor is a power unit that has stood the test of time. It is giving universal satisfaction in scores of different types of motor-driven appliances—from the Vacuum Cleaner and Washing Machine for the housewife, the Meat Cutter and Coffee Grinder for the butcher and grocer, to the Adding Machine and small Printing Press for the office.

Let us assist you in selecting or building the right motor under one h.p. to operate the machine you are now or contemplate making.

Friction Surfacing Cuts Power Bills

Here is a statement that you can prove to your satisfaction and profit.

Take the meanest drives in your plant—the ones you know are wasting power in slippage on pulleys — ask our belting engineers to specify the correct size of

Dominion Friction Surface Belting

Keep a careful record of those belts for one or two months, or even a year, and compare it with the previous performance of those same drives—then compare *your* power bills for the two periods.

Dominion Friction Surface Belting will prove, in service, every claim we make for it, because the rubber with which it is saturated is a special friction compound that prevents practically all slippage and pays for itself in the power saved.

Our engineers are ready to help you, without charge, increase *your* production and lower *your* cost by making *your* transmission more efficient.

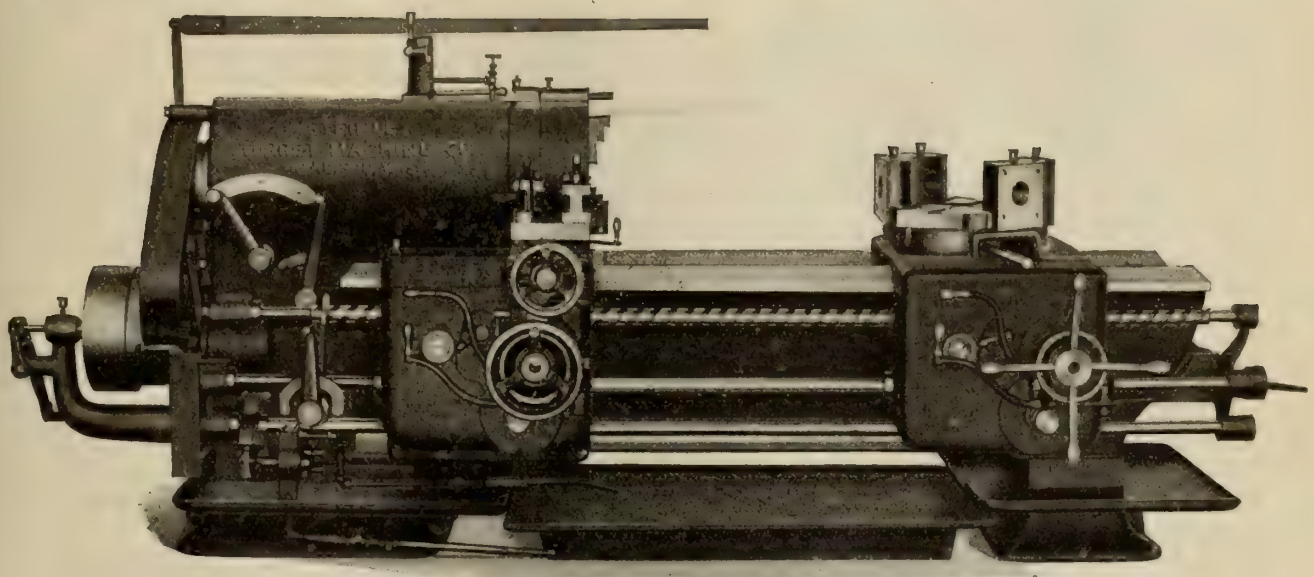
STEINLE



Still another reason why the Steinle 24" Full Swing Side Carriage Turret Lathe is ahead of all others in the economical and accurate production of many classes of work.

THE COMBINATION TURRET

In designing this turret the following points were taken into careful consideration:

The proper manner of supporting different kinds of tool equipment required on a machine of this character.

Avoidance of excessive tool overhang.

Ability to secure the full benefit of the side carriage in relation to the absence of turret tool overhang.

As regularly furnished, the combination turret is hexagon in form, 21" in diameter, and has two open sides and four bored faces. The open sides permit of universal facing heads or similar tool equipment being firmly secured to the bed of the turret and provide for suitable adjustment of tools to the work with a minimum overhang. The bored faces carry drills, boring bars, reamers, die heads, taps, etc.

The combination turret has power traverse and quick change reversible longitudinal feed controlled from the apron.

The bearing on the saddle is the full diameter of the turret. The locking pin is located in front, the greatest possible distance from king pin. One motion of the binding lever releases the pin and turret, or binds same.

The design of the combination turret secures the full advantage of the side carriage feature.

Photographic Copying
The PHOTOSTAT

(Trade Mark Registered)

"Orders are now delivered three or four days earlier to our customers by making photographic copies of sketches and drawings which are the same in every detail instead of having our draftsmen reproduce the original.

"Practically all orders were previously held up three or four days by our drafting department while copies of the intricate drawings of ordered tools were being made. Now with the Photostat, only 15 or 20 minutes are required to make the three copies, exact duplicates of the original, which the factory needs to turn out the order. By eliminating this needless delay we are able to provide better service for our customers, and attract new prospects because of prompt deliveries."

This cut shows a PHOTOSTAT on which a large drawing has just been copied in less than a minute.

Never Makes a Mistake

It is simple, practical, easy to handle. Requires no expert knowledge. The machine is loaded with a roll of sensitized paper especially manufactured for the purpose.

The original subject is photographed directly upon this paper producing a facsimile copy which is immediately cut off, developed and fixed right in the PHOTOSTAT itself.

The focusing, exposing and developing are all controlled by simple mechanical devices and no glass plate, film or other intermediate negative has to be made.

After fixing, the copy is removed to a tank of running water and rapidly washed free from chemicals. It is then dried and is ready for use. As many copies as desired may be run off in this manner.

By a simple adjustment of the mechanical focusing device the copy may be made at actual size, reduced, or enlarged, within the size limitations of the machine.

Error in copy is impossible because every copy is an absolute facsimile. The operations are all simple, such as a boy or girl can do.

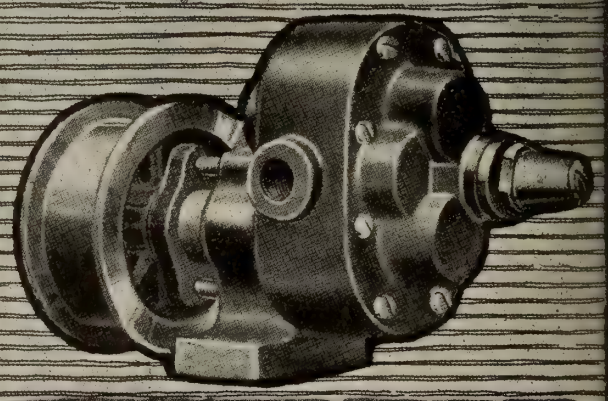
Lubricating Pumps



Need no introduction to Machine Tool Manufacturers. They are known the world over as the reliable Rotary Geared types.

Trahern Pumps specialize in delivering a continuous, forceful, non-pulsating stream of oil, against 100 lbs. pressure if necessary. If installed properly will not loose prime, operate at low speed, long life.

TRAHERN PUMP DIV.
Rockford, ILL., U.S.A. **Geo. D. Roper. Corp.**

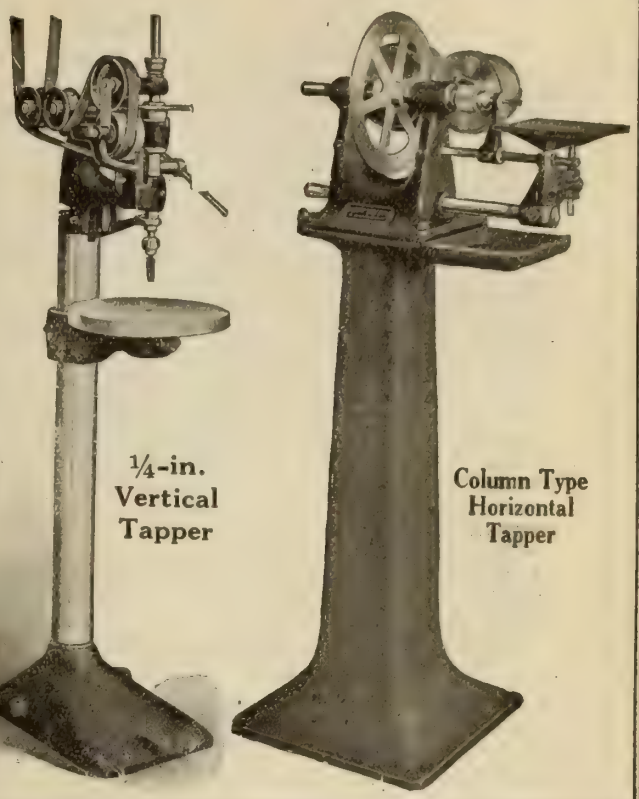
RICKERT - SHAFER TAPPERS

Save Tap Breakage

The *smooth drive* reduces the strain on the taps—they wear longer—and there are fewer delays from taps breaking in the work.

R-S Tappers ensure faster tapping and quicker assembling.

Friction drive, absorbing all the shock, allows a chuck speed of 140 r.p.m. on 5/8-in. work—50 per cent. faster than the usual tapping speed for that size. Uses but 1 h.p.



¼-in. Vertical Tapper

Column Type Horizontal Tapper

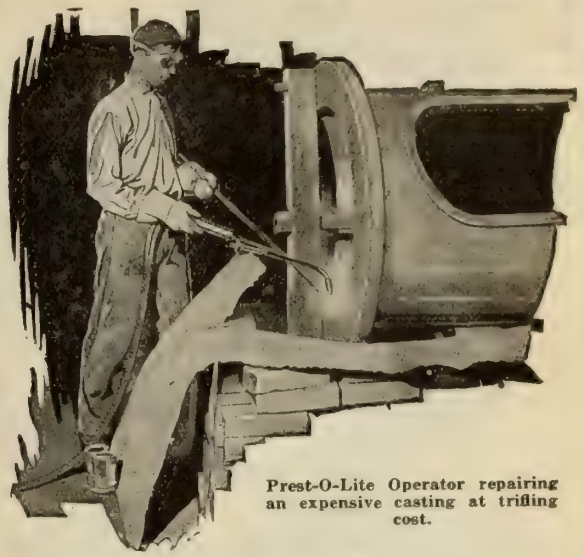
Oxy-Acetylene Welding and Cutting



Prest-O-Lite Operator repairing an expensive casting at trifling cost.

Prest-O-Lite Welding Saves Replacements

The Prest-O-Lite Process of Oxy-Acetylene welding is daily opening up new possibilities for economy and efficiency in the factories, mills, railroads, mines and machine shops of Canada.

For repair work, as well as for manufacturing, it is saving time and money in thousands of plants. Valuable time is saved through one Prest-O-Lite repair. Important machinery, machine parts and tools are saved from the scrap pile, and expensive replacements are frequently avoided.

Prest-O-Lite PROCESS

employs both gases (acetylene and oxygen) in portable cylinders. Prest-O-Lite Dissolved Acetylene is backed by Prest-O-Lite Service, which insures prompt exchange of full cylinders for empty ones; provides dry, purified gas, insuring better welds, quicker work and lower operating cost.

Apparatus consists of an equal pressure blow pipe, automatic regulators and gauges, and all necessary equipment. Adaptable for oxy-acetylene cutting by the addition of special cutting blow pipe.

Thorough instructions are furnished free to every user of Prest-O-Lite Dissolved Acetylene. Any average workman who understands metals can learn the welding process quickly and easily.

We will gladly send illustrated literature and interesting data showing actual instances of savings made by others. It may suggest vauable ideas to you. Write for it.

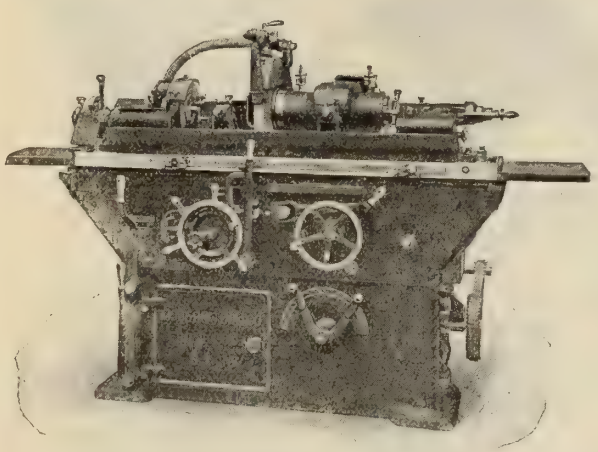
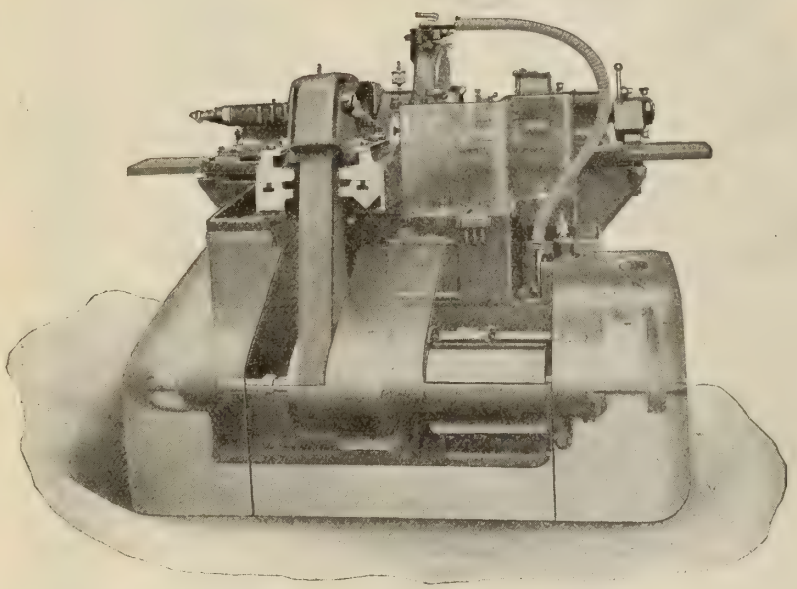
MODERN PLAIN GRINDERS



The Success of Modern Plain Grinders results chiefly from all around superiority.



—They're accurate—and stay so.

—They're durable—stay on the job.

—They're dependable—rugged and rigid. Do not easily get out of order.

—They're convenient—all controls on front of machine in easy reach of operator.

—They're fast — Moderns are noted for big output.

—Moderns are made in 10 sizes, 8″ x 18″ to 16″ x 60″.

Send us blueprints and specifications and we'll prove Modern's ability on your job.

Send for complete technical bulletin.

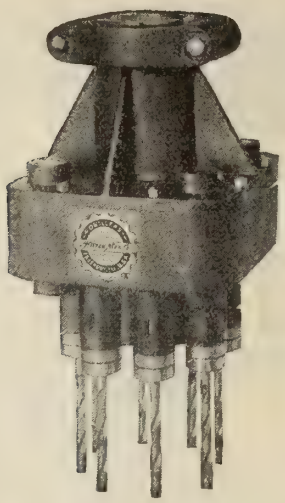
2 Minutes or 20?



This Is The Vital Question

Do you drill ten holes in the time it takes for one? The Hoefer Auxiliary Head equips any driller so as to accomplish this big saving in time. It speeds up production in drilling tremendously. Not only do you save the drilling time, but also the time now lost in shifting the jigs and raising and lowering the spindle for the extra holes.

Hoefer Auxiliary Heads are made in any multiple, arranged in any manner, from 2 up. They are made by expert tool makers and unqualifiedly guaranteed to handle accurately the work for which they are designed.

Investigate now—every day you use a single drill where the multiple may be used you are paying for an auxiliary head through increased costs, but not securing its benefits.

Write for catalog. Send a blueprint of some of your work for estimate of time and cost.

The Connecting Link between Power and Production

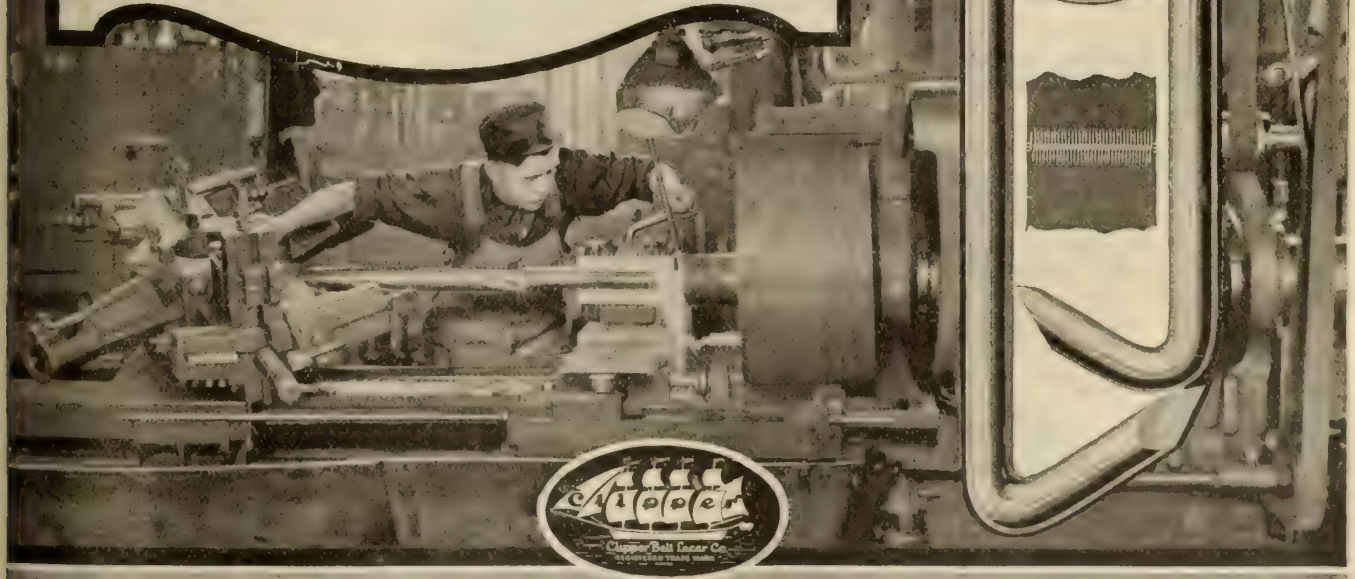
MAXIMUM production can only be attained through uninterrupted transmission of power from line-shafts to machines. Belts *will* break. Because no method to-day equals the "Clipper" for speedy repairs, "Clipper" belt hooks are the connecting links between power and production. "Clipper" hooks make possible practically continuous operation of machines during working hours in the workshops of the world.

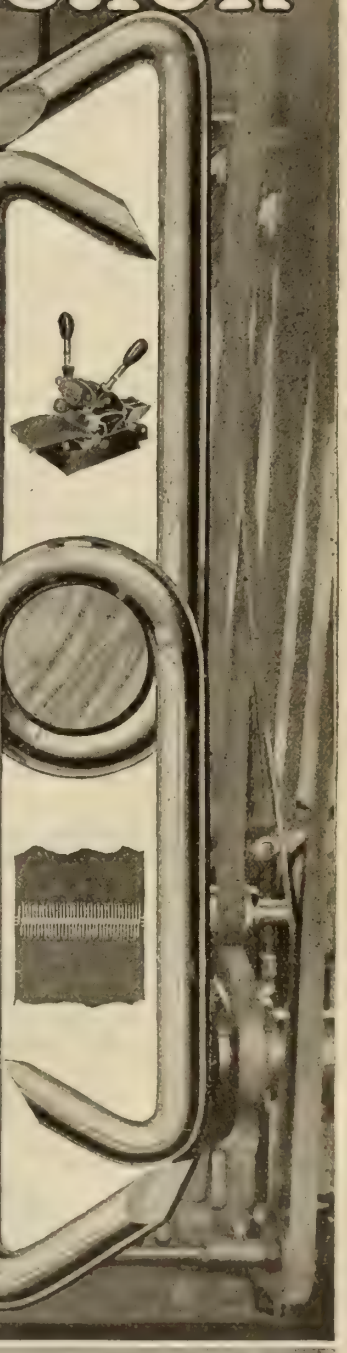
The Clipper Belt Lacer
Laces a Belt in Three Minutes

Out-of-date methods take from ten minutes to half an hour. The "Clipper" makes a durable joint—one that is smooth on both sides, is as flexible as the belt itself, is safe and pulls right.

The "Clipper" goes to manufacturers on free trial and is perpetually guaranteed.

Clipper distribution is world-wide through mill-supply houses. Where we are yet open for representation our dealer proposition is one of mutual profit.





Clipper Belt Lacer Company

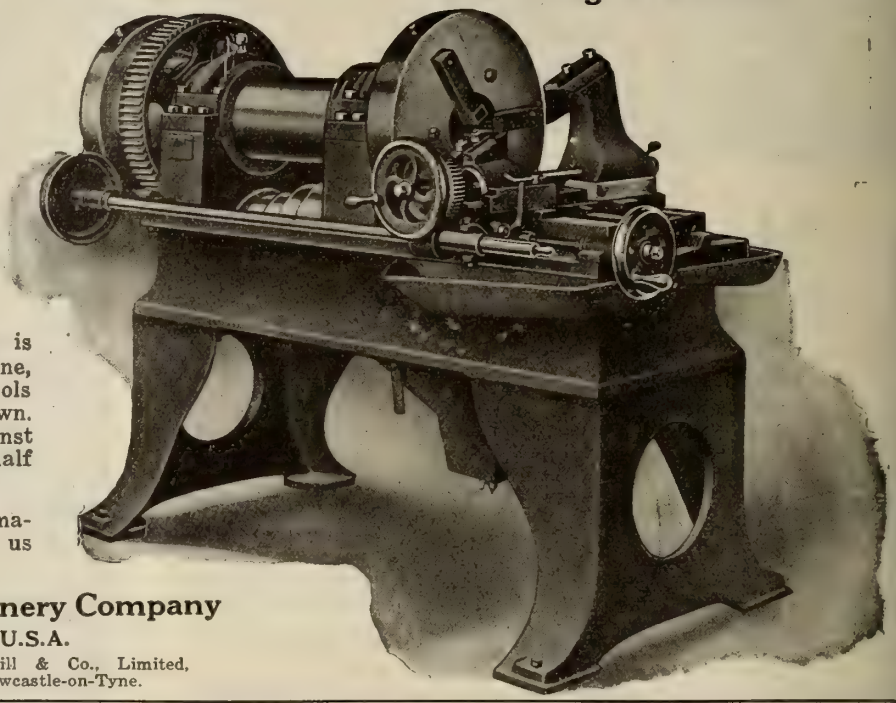
Cut Your Cutting-off Costs in HALF

HURLBUT'S

Patent Cutting-off and Centering Machines



TO say that the Hurlbut, Rogers Cutting-Off and Centering Machine will **double your production** and **cut your costs in half** may seem like a broad claim. But this is just what this machine will do compared with any ordinary machine of its kind.

Hurlbut, Rogers speed and efficiency is easily explained. Instead of only one, it is equipped with two cutting-off tools —one cutting up and the other down. In this way they hold the work against each other and finish a job in just half the time and do twice the work.

You can't afford to be without this machine. It saves real money. Let us tell you more about it. Write!

The Hurlbut, Rogers Machinery Company

South Sudbury, Mass., U.S.A.

Foreign Agents—England: Chas. Churchill & Co., Limited, London, Manchester, Glasgow and Newcastle-on-Tyne.

Gear Cutting with the "IF'S" Left Out

The Gear Shaper Way

A production manufacturer knows that he will secure good gears IF he has an accurate cutter, an accurate machine and a machine working on the correct principle. The whole question of good gears is resolved in this one little word "IF."

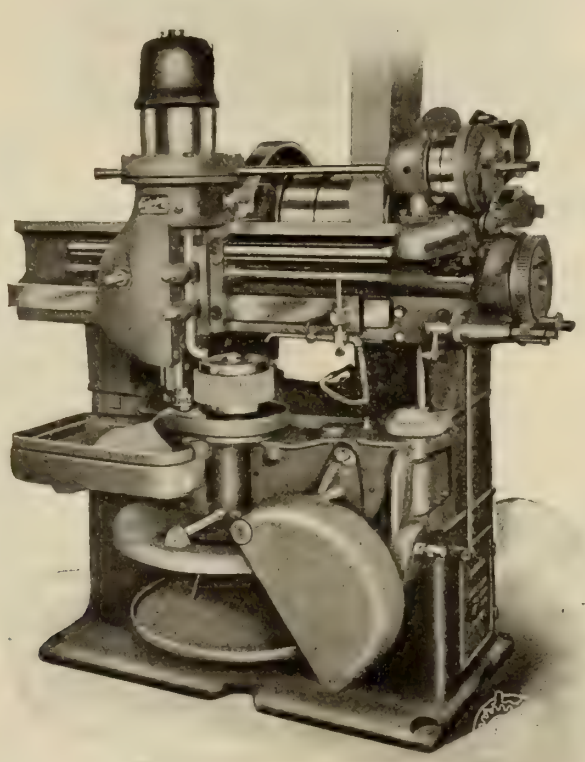
When the Gear Shaper was originally designed, the question of "IF" was taken into consideration and every possible means known to mechanical engineering was employed to eliminate the "IFS" from gear cutting.

That we have been successful in solving the problem is evidenced by the fact that each ensuing year sees a larger number of manufacturers adopting the Gear Shaper method.

How the Gear Shaper has accomplished this is clearly explained in our general catalog "Commercial Gear Cutting," which is a treatise on the subject of:—

Gear Cutting with the "IFS" Left Out.

Send for your copy to-day



The Fellows Gear Shaper—the machine which has taken the "IFS" out of gear cutting.

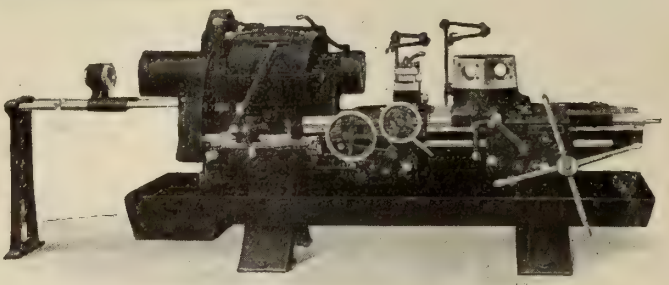
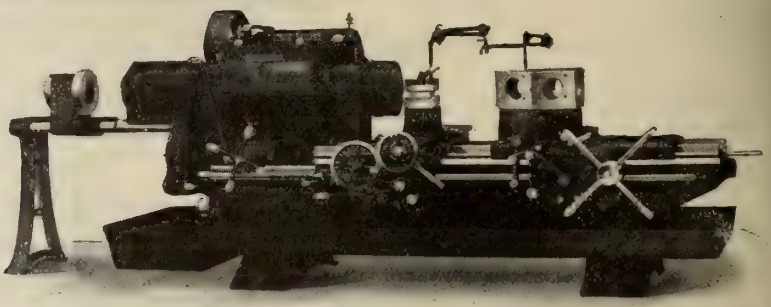
BAR CAPACITY FOSTER UNIVERSAL TURRET LATHE

1-B
2" x 20"



2-B
3¼" x 30"

3-B
4½" x 40"



HOW ARE YOU EQUIPPED FOR BAR WORK?

Have you checked up the machining cost of your shafts and other bar work lately? Are you keeping the cost down to the old level and at the same time increasing the wages of your men and thus making them able to meet the steadily mounting cost of the necessities of life?

Some people have not analyzed their cost figures yet.

Others have.

The Foster Universal Turret Lathes are capable of increasing your production per man. We are not particularly interested in what equipment you are using now; we **know that** we can increase your production.

The machines have the power. It is now a question of how heavy a cut the tool will stand up under, not of whether the machines will pull.

The general design of the machine, the reducing the overhang to minimum, the weight and massiveness of the bed lend rigidity in a high degree.

The centralized control saves the operator's time and energy, and increases your, and his earnings.

It will pay you to investigate the merits of the Foster Universal Turret Lathes. Your competitors probably have one or several of these machines in their factory already. If they do it has given them the drop on you.

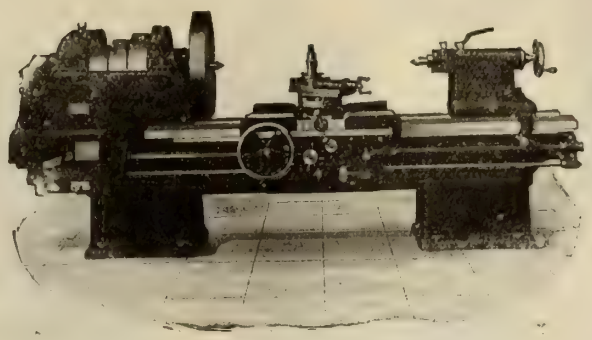
OUR CATALOGUE SHOULD BE IN YOUR FILE—WRITE TO-DAY.

FOSTER MACHINE CO., ELKHART, IND.

SIDNEY

Sidney for Service

Sidney-for-Service Lathes are noted for their power and rigidity. Take deep cuts through toughest metal without pause or chatter.



Specifications include 3-step cone, double brake gear, semi-quick change gear lathe, built on 10 ft. bed. This lathe also furnished with quick-change gears. Bed lengths available: 10, 12, 14, 16, 18 and 20 ft.

The Sidney Line comprises 15-inch, 17-inch, 19-inch, 25-inch, 27-inch, 30-inch and 36-inch lathes, which are adaptable to the finest tool room work or the heaviest duty shipyard or factory rapid production work.

FRANKLIN DIE-CASTINGS

ONE OF THE SHOP'S GREATEST HELPS

The use of Franklin Die-Castings is a sound means of improving your product.

As compared with machined parts, die-cast parts mean less finishing, less trouble, less time, less labor, less cost—more uniformity, more dependability, more rapidity of production.

Franklin Die-Castings have been successfully applied to many industries during the last twenty-seven years. They were the pioneer die-castings—and have always been the standard.

We cast in aluminum, zinc, tin and lead base alloys. Quantity deliveries assured.

Booklet "C" sent on application. Sample of part, or blue print brings our quotation promptly.

McCrosky

McCrosky WIZARD Quick-Change Chucks and Collets

WIZARD production is continuous output on many jobs. On any job they will pay their own cost in a short time.

The tools are changed in rapid succession, without stopping the spindle for a moment and while running at any speed. Will more than double your drill-press in one continuous operation.

With the WIZARD you can drill, ream, counterbore, tap, set studs, etc.

Think what it means to turn out completed jobs with only one handling of the work. It means cutting out costly lost motion which eats up your profits. It means that a WIZARD outfit enables a girl to do more and better work than two men, the old way.

It means keeping your plant busy when the less efficient plant is having a hard time to make ends meet.

Read the full story of the WIZARD and other McCrosky Cost Cutting Tools in Efficiency Book No. 6. Yours on request.

Blast Gate Supersedes Gate Valves and Stop Cocks

"These have given entire satisfaction."
CANADIAN PACIFIC RAILWAY COMPANY
Montreal, Canada

For low and moderate pressures our New Air-Tight Blast Gate easily supersedes the heavy, cumbersome, expensive and slow-acting gate valves and stop cocks.

Costs only a fraction of what you pay for gate valves and stop cocks and saves time and labor.

Write for Circular 123-T. It tells how our blast gate is made, how it works and what users think about it.

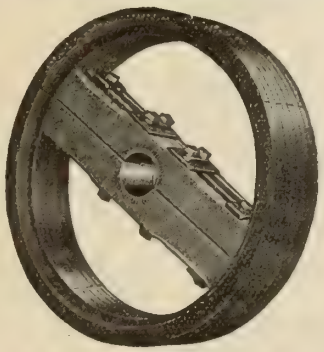
IT IS IMPORTANT

when advertising that as many prospective buyers as possible read what you are selling. We advise you to use **Canadian Machinery.**



General Efficiency Demands the Use of

BERNARD
Wood Split Pulleys

The war is ended so far as a continuation of the bloody combats of the battlefields is concerned. But in the war after the war there will be waged lively battles for industrial supremacy wherein the advantage will lie with the plant equipped with the most economical and durable machinery.

Competition will be more intense, and in this connection, keep your eye on the overhead. It has been looming large these past few years and must certainly come down.

BERNARD Wood Split Pulleys will help you eliminate power waste; their cost is low, their efficiency is GREAT.

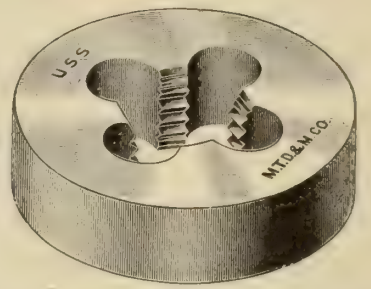
"MORSE" ROUND DIES

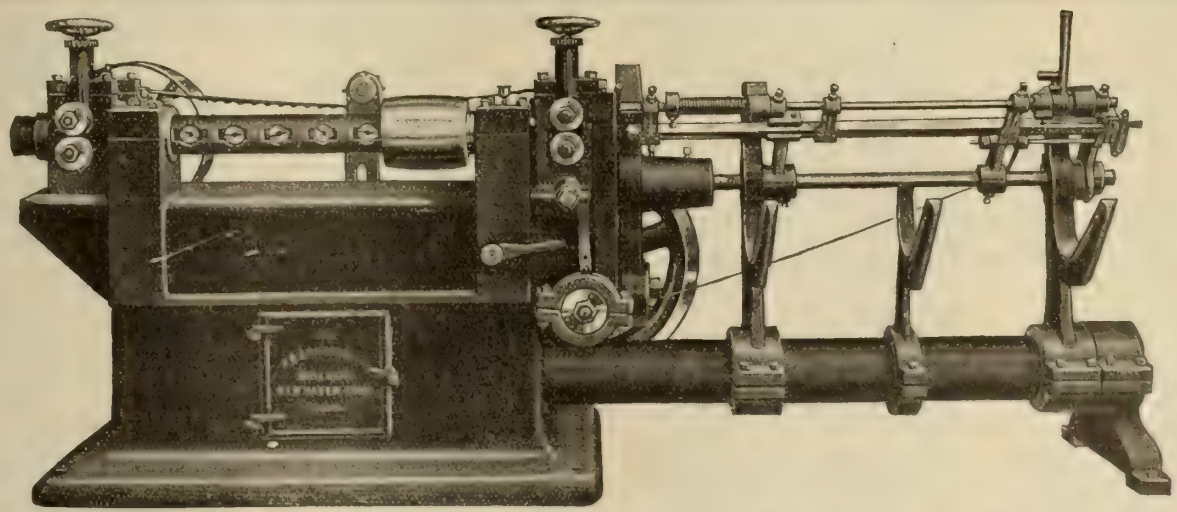
FURNISHED IN EITHER SOLID OR ADJUSTABLE TYPES, SINGLY OR IN SETS. V. U.S.S. or WHITWORTH SHAPE of THREAD.

THESE DIES CUT CLEAN, ACCURATE THREADS AND HOLD THEIR SIZE.



MORSE TWIST DRILL & MCH. CO.

NEW BEDFORD, MASS., U.S.A.



Perfect Wire Straightening Quickly and Profitably Done on Our

Automatic Wire Straightening and Cutting Machine

Just put your coil of wire on the reel, adjust the rolls and dies, and set the gauge for the length you want. The machine does the rest—thousands of feet per day, perfectly straight and cut to accurate lengths.

Catalogue tells more about them, and we will be glad to send you a copy.

THE F. B. SHUSTER CO., New Haven, Conn.

FORMERLY JOHN ADT & SON ESTABLISHED 1886

ALSO MAKERS OF STRAIGHTENERS FOR SQUARES, HEXAGONS, FLATS, ETC.

Nichrome the Casting Durable

Oxidizing Atmospheres Lengthen the Life of

Nichrome Heat Treating Containers

Under conditions where cast iron or steel retorts, boxes and pots last only several hundred hours, Nichrome Castings last thousands of hours. At 1800° F,. and under oxidizing atmospheres, Nichrome service records reach to two years—and still going strong. First cost economy is assured by a D-H guarantee.

The saving in fuel—because "oxidized atmospheres" produce better combustion; the saving of time—because of high heat conductivity and more continuous operation of furnaces; the uniform results in the heat treated products—because Nichrome castings retain their original characteristics and shape under repeated heating and cooling: These are additional advantages of Nichrome heat-treating containers.

Let us show you Nichrome service reords in heat treating work like yours. No obligations.

Manufactured Under Henderson Patents

A Plant Equipped in Every Detail to Suit Your Every Need

STEEL PRODUCTS

Open Hearth, Basic and Acid, Electric and Alloy Steels.

CASTINGS

For Ships, Railways, Rolling Mills, Gears, Machinery and Ingots to 35 tons.

RAILWAY SPECIALTIES

Penn Couplers, Bolsters, Truck Side Frames, Draft Gears.

FORGINGS AND BILLETS

Heavy Ship Forgings, Locomotive and Car Axles, Miscellaneous Forgings.

PLATES

Plates and Heavy Sheets to 30 inches wide, Soft and High Carbon, Automobile Plates and Sheets.

AGRICULTURAL STEEL

Soft Centre and Solid Plow Steel, Harrow Discs, Shovel Steel, Cultivator Blades.

DOMINION FOUNDRIES AND STEEL, LIMITED
HAMILTON, CANADA

Cleveland Sand Rammers
FOR FLOOR, BENCH, PEIN AND FLASK RAMMING

Cleveland Sand Rammers are made in several sizes and weights, and are adapted for all kinds of Ramming in general foundry service.

The Piston Rods are packed with a resilient packing that conforms to the shape of Rod without retarding its free action, and prevents any dirt from entering piston chamber and working parts — Rammers are fitted with either Round or Flat Rods as required. Cleveland Rammers are light in weight, have high speed and practically no vibration, making them ideal foundry tools.

CLEVELAND CHIPPING HAMMERS

For General Foundry Work. Are furnished in any required size or weight for grey iron or steel castings; they have high speed, and are particularly adapted for fast chipping now required by piece-work operators.

BOWES AIR HOSE COUPLINGS

Standard Equipment Everywhere

Bowes Couplings are instantly connected or disconnected.

Bowes Couplings are absolutely air tight under all pressures.

Above cut shows the Never-Slip Clamp attached to Bowes Coupling.

In Stock:—RIVETING HAMMERS, DRILLS, REAMING, TAPPING AND FLUE-ROLLING MACHINES, CORNER DRILLS, PORTABLE AND BENCH GRINDERS, ETC.

Write for Bulletins, 34A, 41 and 43.

Cut your Metal faster—

more accurately—more economically—with this

SPECIFICATIONS:

Capacity, 10″ x 10″.
Floor space, 4′ x 6′.
Height, floor to table, 26¾″.
Length of Band Saw, 12′ 3″.
Size of Band Saw, 1″ x .035″.
Belt or Motor Driven.
Power required, 1 H.P.
Driving Pulley, 12″ x 3″.

FEATURES:

Continuous cutting—hence FAST.
Gravity feed—EASY on saw.
Roller guides—ensuring SQUARE, ACCURATE cuts.
Blade .035″ thick—SAVING metal.

Napier Metal-Cutting Machine

The ONLY Horizontal Band Saw Made

SAVES METAL—because the cutting band is only .035″ thick, and less metal is removed than with any other machine. Compare it with a cold saw's gash!

SAVES TIME—because its thin, continuous, one-way cut is at least twice as fast as the half-the-time cut of the power hack-saw.

SAVES POWER—because it removes a minimum amount of metal, in the easiest possible way.

CUTS SQUARE AND TRUE—because the roller guides, close to both sides of the work, hold the inch-wide blade rigid and unswerving. Gravity instead of force feed eliminates the tendency to run off.

BAND SAWS WEAR LONG—because every tooth is used. Because the length of the saw, and the contact with the wheels, keeps it cool. Because the spring-counterbalanced gravity feed allows the saw to "give" when it strikes a hard spot.

MACHINES STAND HARD SERVICE—Napier Metal-cutting Machines are simple, rugged, free from weak points. They stand hard, steady service in unskilled hands and **turn out the work.**

Speed up your hand and power hack saws by using NAPIER blades!

Made by

Napier Saw Works, Inc., Springfield, Mass.

Heat Under Accurate Control

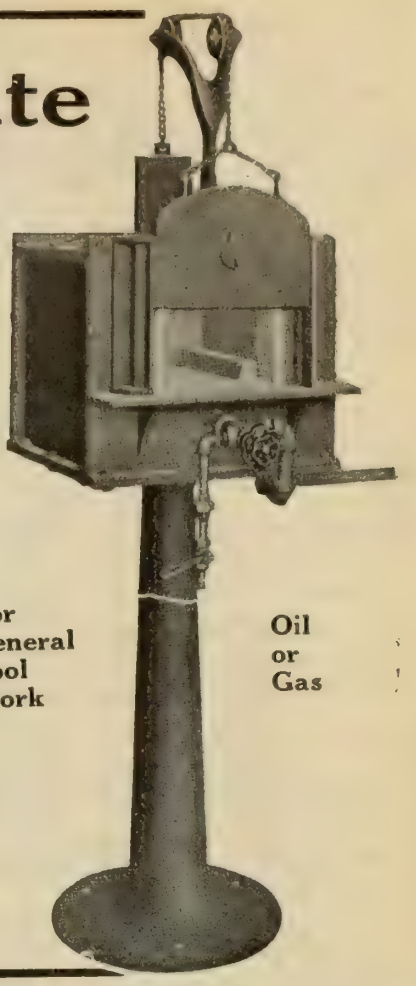
Here is an important factor in the heat treatment of metals. An intense heat, rapidly developed, and always under accurate control of the operator, are features that distinguish

BELLEVUE FURNACES

These tool forges are particularly adapted for the requirements of the small machine shop for annealing and tempering dies, cutters, reamers, etc.

Combustion is perfect and no flames come in contact with material. Built to stand the highest temperature. Doors are properly counterbalanced. In every way BELLEVUE FURNACES meet with the demand for durability, efficiency and convenience.

Let us advise you about your heat-treating problems.



For General Tool Work

Oil or Gas

Bellevue Industrial Furnace Company

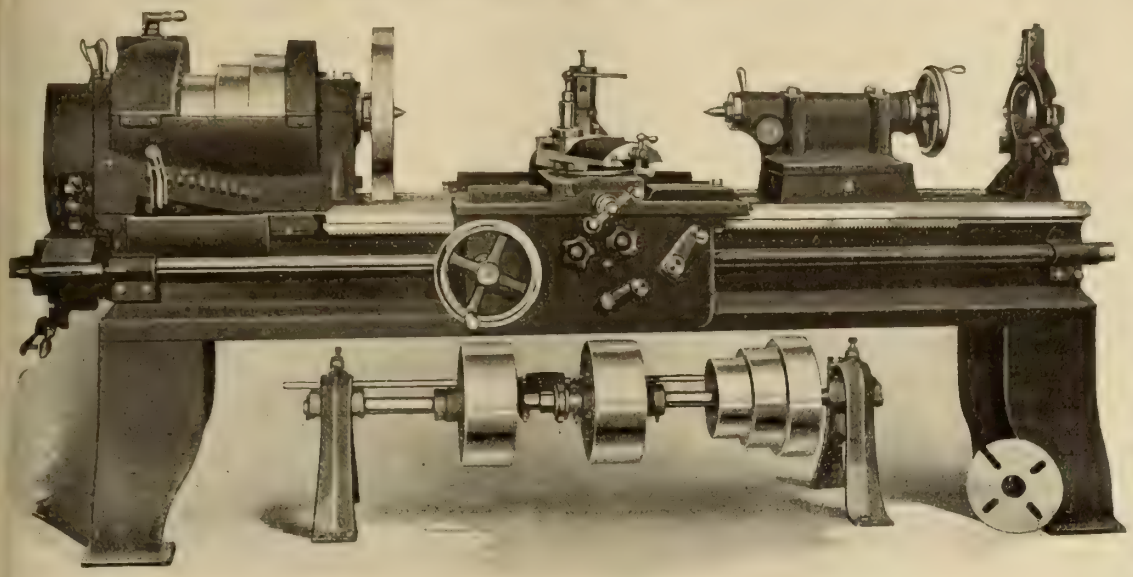
The "RAE" 18-Inch Quick Change Double Back Geared Lathe



New Type of Webbed Headstock Insures Great Strength and Rigidity Under All Conditions.

When You Buy a Lathe what do you expect?

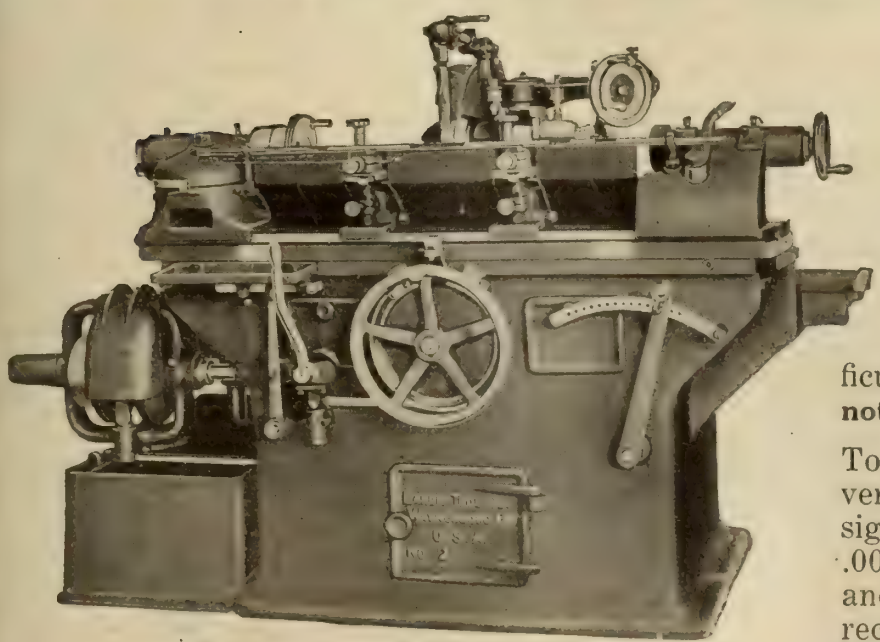
Some buy simply because of the name, but the real intelligent buyer goes deeper into the problem.

He wants to feel sure that the material and workmanship is there, together with economy of upkeep. Accuracy must be a strong point in its favor. All these features are combined in every Rae Lathe shipped from our plant.

Rae Machine Tool Works, Limited, HAMILTON ONTARIO

The Productive Landis Universal

WILL COMPLETE YOUR TOOL-ROOM GRINDING EQUIPMENT



These are "High Pressure" times that require "High Pressure" methods and equipment.

Unless your **Tool Room** is equipped for "High Pressure" work, your capacity is lowered; and unless you have the machines to handle the varied and difficult jobs, your **Tool Room cannot** compete.

To this end, the LANDIS Universal Grinding Machine is designed to work accurately to .00025" in handling varied lines and yet establish production records.

Send for our catalog.

Smalley General Thread Millers are sold subject to guaranteed production estimates. If they do not produce according to our estimates sales may be cancelled.

Before our engineering department can issue a guaranteed time, study and production estimate they will require blue prints and, as a rule, samples of the part to be milled.

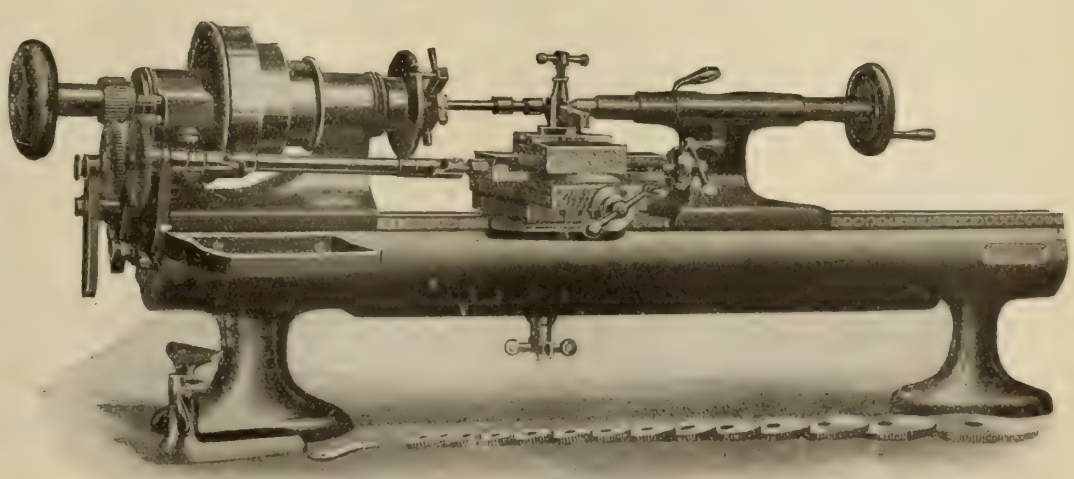
Sample parts may be sent by express at our expense. They will be returned, after being milled, for examination as to accuracy and quality of thread.

No obligation is incurred in referring to us any question relating to thread milling.

SMALLEY GENERAL CO., Inc.
BAY CITY, MICHIGAN
Canadian Agents: Rudel-Belnap Co., Ltd., Montreal and Toronto

CATARACT BENCH LATHES AND ATTACHMENTS

Cataract Bench Lathes are finely constructed precision tools, with responsive controls, simple adjustments and numerous convenient attachments adapting them to a wide variety of work. **Study this illustration.** Note the base, the circular bed, the sliding tool post, massive head stock (indicating strength), range of gears, special tailstock, arrangement of gears.



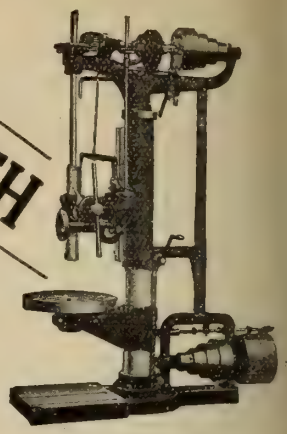
Hardinge Bros., 1770 Bertau Avenue, Chicago, Ill.

ALFRED HERBERT CO., Limited, Coventry, England, are our representatives for United Kingdom, France, Belgium, Russia, Japan, Manchuria, Korea, Formosa, China, Italy.

If interested tear out this page and place with letters to be answered.

SPEED PLUS STRENGTH

SILVER DRILLS



20-Inch

25-Inch

STRONG, speedy, accurate and dependable 20 and 25-inch drills, in which simplicity and convenience mark every feature.

They are in great demand for all modern machine shop practice.

Compact, Efficient, Economical

The 20-inch drills are made in four distinct styles with plain lever feed, lever and wheel feed, power feed and automatic stop and back gearing.

SERVICE

and "THE COVENTRY" Chains are synonymous terms. This is attained by correct design, the use of special analysis steel, first-class workmanship and a rigid system of examination.

These, combined with a determination to produce only the best, give that steady, continuous service which is an essential feature of "THE COVENTRY" Chains.

The same service is at your disposal. If you wish to instal the most efficient form of Power Transmission, our Technical Staff will gladly give you all the assistance needed, without obligation, and without prejudice to any particular form of drive.

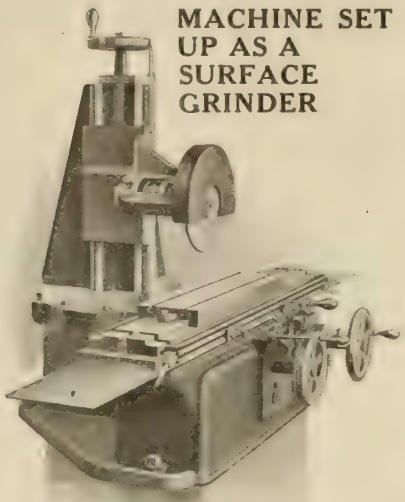
FRASER No. 1 Universal Convertible Grinder

(Patented May 28, 1918)

MACHINE SET UP AS AN INTERNAL GRINDER

MACHINE SET UP AS A SURFACE GRINDER



By the change of heads the machine can be converted into an efficient high-speed internal grinder; also a surface grinder of considerable range.

PATENTED APRON CONSTRUCTION. All the springs on this machine are enclosed and can be removed or replaced without disturbing any other part of the machine.

Capacity: Cylindrical work 8 in. x 2 in.
Surface work, 6 in. x 20 in.
and up to 8 in. in height.

Some of the Lines we represent:

Tungsten Hack Saw Blades

PLANERS

SIZES 24" 30" 36" 42" and 48"

Any Length of Bed. Various Drives by Belt or Motor
Number and Arrangement of Heads as Desired

Our planers are built to combine solidity and accuracy with convenience and speed of operation. An unstinted and intelligent use of metal gives the machine an absolute rigidity under heaviest cuts, while the operating mechanism and adjustments are as simple, effective and convenient as possible.

P & W

Pratt & Whitney Taps

"With the 'Con-eccentric' Land"

P & W Taps are **good** taps —easily the best where accuracy and high speed are essential. They cost more to buy, but less to use than others.

If you're doing work that calls for big production and for unusual precision give them a trial. You'll be back for more when you see them prove themselves.

The "con-eccentric" land — the special feature of Pratt & Whitney Taps permits sharpening on face of the cutting edge without affecting size. It lengthens life and assures accuracy hitherto thought impossible in a commercial tool.

Where You Can Buy Them—

New York, 326 Hudson St. **Boston,** 93-95 Oliver St. **Philadelphia,** 405 N. 21st St. **Cleveland,** 730 Superior Ave. **Detroit,** Kerr Machy. Bldg. **Chicago,** 571 W. Washington Blvd. **St. Louis,** 516 N. 3rd St. **Cincinnati,** 336 W. Fourth St. **Birmingham, Ala.,** 2015 First Ave. **St. Paul, Minn.,** Robinson, Cary & Sands Co. **New Orleans,** C. T. Patterson Co., Ltd. **San Francisco,** 16 to 18 Fremont St. **In Canada—** Pratt & Whitney Co. of Canada, Ltd., **Dundas, Montreal, Toronto, Winnipeg, Vancouver.**

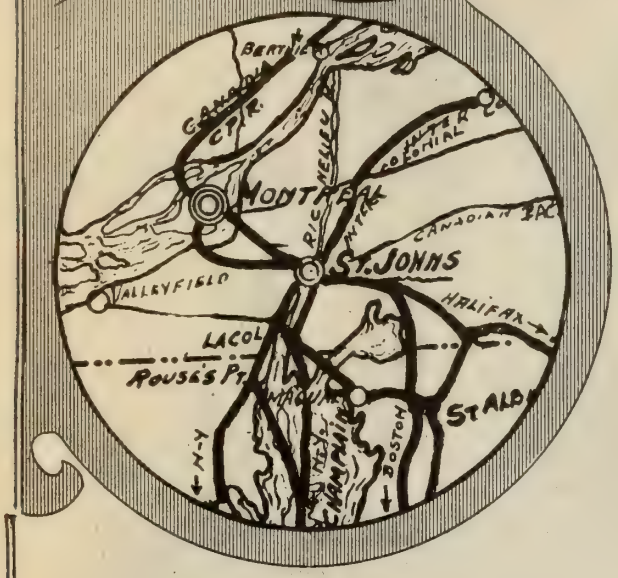
Canadian Machinery and Manufacturing News, December 11th, 1919. Vol. 22, No. 24. Published weekly at 143-153 University Ave., Toronto, Canada. Subscription price in Canada, $3; United States, $3.50. Entered as second-class matter at the Post Office Department, Ottawa, Canada. Entered as second-class matter July 1, 1912, at the Post Office at Buffalo, under the Act of March 3rd, 1879.

The City of ST. JOHNS, QUEBEC



ITS LOCATION

It is located in the Province of Quebec which, as regards industries, is to Canada what New England is to the United States. (It is 27 miles, or 45 minutes, from Montreal).

ITS RAILWAYS

The two big railroad systems (double track) of Canada, the Canadian Pacific and the Grand Trunk Railways, pass through St. Johns, where merchandise can be shipped and exported anywhere upon the globe with dispatch. These railways are connected by a terminal switching system: charges at exceedingly low rate. All Eastern U.S. railroads are connected with St. Johns.

Direct Connections with Docks at Montreal

Goods can be exported direct by steamers to European, South African, South American and West Indian Ports.

St. Johns has long been recognized as the cheapest labor centre in Canada. Reasonable rents and living costs are keeping it so even in these times.

No other locality offers the following inducements to new industries---but we do

Exemption of taxes for fifteen years' period that is subject to extension. All public improvements which you may require, such as extension of streets, sidewalks, waterworks and sewerage; five per cent. bonus to you on your payroll for five years and if you wish we will advance this to you to be applied to the purchase or erection of any building suitable to your purpose.

ANNOUNCEMENT

THE ALGOMA STEEL CORPORATION, LIMITED, take pleasure in announcing to their customers and the Canadian trade that in accordance with the widespread desire throughout the Dominion that there should be obtained in Canada with Canadian labor, a much larger proportion of the requirements of this country in STEEL SECTIONS for STRUCTURAL PURPOSES, CAR CONSTRUCTION, SHIPBUILDERS' REQUIREMENTS, etc., they are just completing extensive alterations and additions to their rolling mills, and on or about 1ST NOVEMBER, will be ready to produce and ship American Standard Sections of BEAMS and CHANNELS up to and including 15", all standard sections of ANGLES from 6" x 6" down to 1¼" x 1¼", ZEE BARS for car builders and general purposes, small and large ROUNDS and SQUARES, and FLAT BARS up to 14" wide. The quality of the product is already well known to the trade, and is exclusively steel made by the Open Hearth process, and can be furnished in all grades from the softest rivet stock to high carbon special spring material.

The following are the sections which will be rolled:---

ANGLES—Equal Leg—
6 x 6"—5 x 5"—4 x 4"
3½ x 3½"—3 x 3"
2½ x 2½"—2¼ x 2¼"
2 x 2"—1¾ x 1¾"
1½ x 1½"—1¼ x 1¼"

ANGLES—Unequal Leg—
6 x 4"—6 x 3½"—5 x 4"
5 x 3½"—5 x 3"—4½ x 3"
4 x 3½"—4 x 3"—3½ x 3"
3½ x 2½"—3 x 2½"—3 x 2"
2½ x 2"

BEAMS—
15", 12", 10", 8", 6", 5", 4", 3".

CHANNELS—
15", 13", 12", 10", 8", 6", 5", 4", 3".

ZEES—
3¼ x 5 x 3¼ x 5/16
3 5/16 x 5 1/16 x 3 5/16 x ⅜"
3⅜ x 5⅛ x 3⅜ x 7/16"
3 1/16 x 4 x 3 1/16 x ¼"

HIGH SPEED AND CARBON TWIST DRILLS

REAMERS AND MILLING CUTTERS

Quality First

The Keystone Upon Which All WILT Products Are Built

A high standard of perfection is maintained throughout the various processes of manufacturing **WILT High Speed and Carbon Twist Drills, Reamers and Milling Cutters. WILT** products improve production! This is no theory, no untested statement, but an established fact backed by many of the largest manufacturers throughout Canada. For steady, reliable output of work that is satisfactory from the standpoint both of quantity and quality there is no better choice than **WILT Products.**

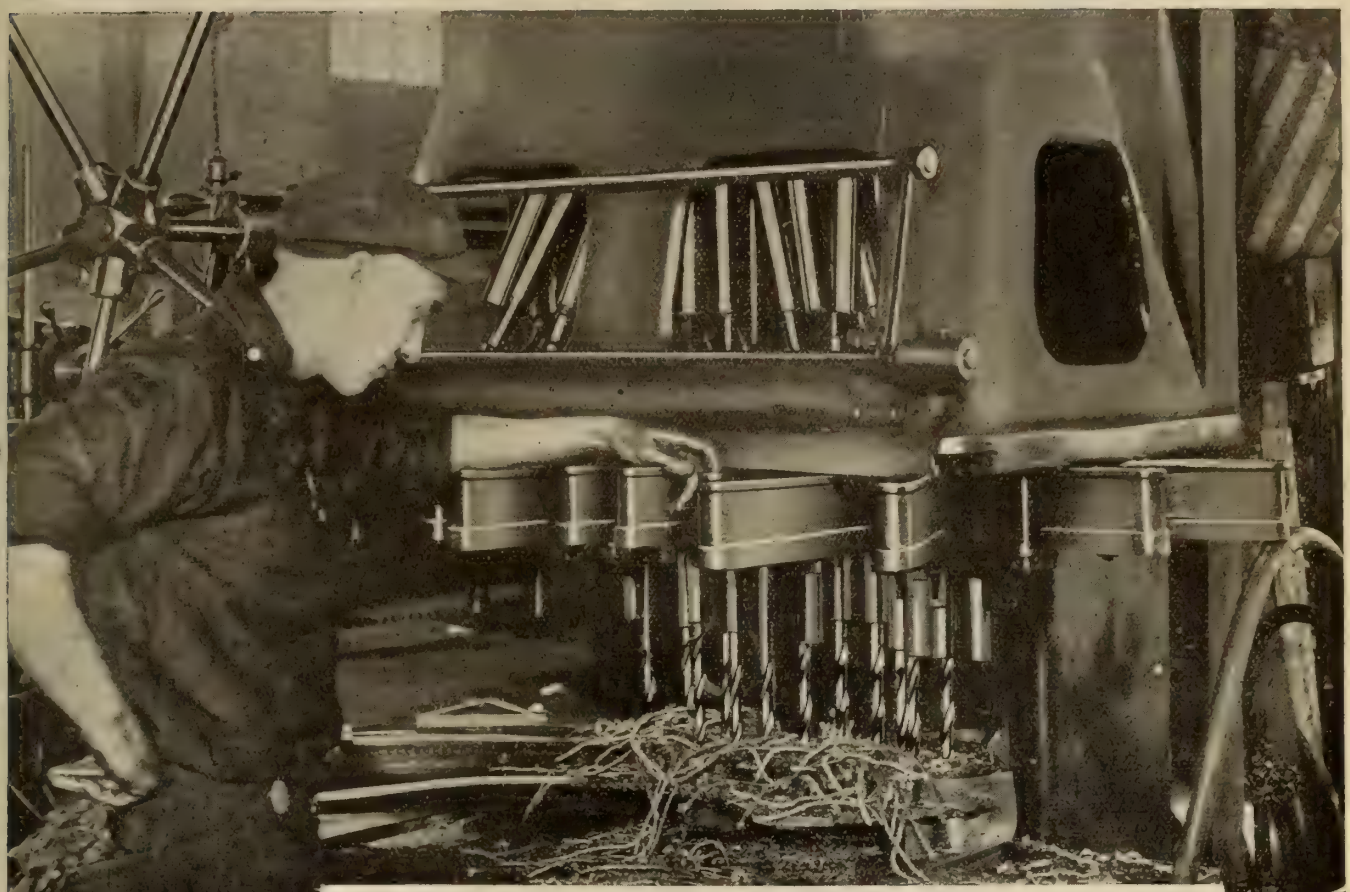
MULTI-DRILLERS NATCO MULTI-TAPPERS



Drilling and Countersinking Nickel Steel Segments

"Most accurate and reliable—surely gets the work out." That's the verdict of the R. D. Nuttall Co., Pittsburgh, who has just become acquainted with NATCO possibilities.

The NATCO drills 12 holes 25-32 inch in diameter to a depth of 2¼ inches. Four of these holes are then countersunk. The piece is a Segment for gun carriage made of nickel steel, and the NATCO does the work at the rate of 18 pieces per day.

Reaming, recessing, tapping, spot-facing, are all within the NATCO range—and the NATCO multi-method has been one of the most prolific production factors where many holes of different dimensions are drilled, tapped, etc., into the same piece. The NATCO patented feature provides approximately the correct speed for each spindle.

We also design and build jigs and fixtures for use in connection with NATCO Multi-Drillers.

MILWAUKEE MILLING MACHINES

Double Overarm maintains alignment.

It is impossible for the operator to place the arbor supports on the arbor and double overarm in any other way than in line. Arbor cannot be pounded out of line when using large, coarse pitch cutters on rough, heavy work.

Other Distinctive Milwaukee Features:

Solid top knee—hardened steel gearing and shafts in the column and feed box—automatic flooded lubrication — one and one-half gallons of oil per minute pouring over all gears and bearings in the column and feed box, insuring lubrication at all times—flanged spindle with hardened steel collar for driving arbors—constant speed drive, reverse being self-contained.

Send for our No. 21 Catalogue. Illustrating and describing Milwaukee Milling Machines and accessories in detail

Announcing—

WILLIAMS' "Vulcan" Forged-Cutter Tool Holders give unequalled service to those who prefer the solid, forged-type of cutting tool. Each Holder, by the mere insertion of small High Speed Forged-Cutters is adapted to the heaviest service on Lathe, Planer, etc.

The economy and convenience of this line, when installed as standard shop equipment, is at once apparent, as all blacksmith work, to say nothing of the very considerable investment necessitated by heavy, solid forged-tools of costly High Speed Steel, is eliminated.

Absolutely simple in construction, yet possessing all the advantages of the solid tool without its expense.

Cutters, drop-forged from the finest grade of High Speed Steel, in stock in a great variety of sizes and types, finished and hardened ready for use. Ask for descriptive booklet.

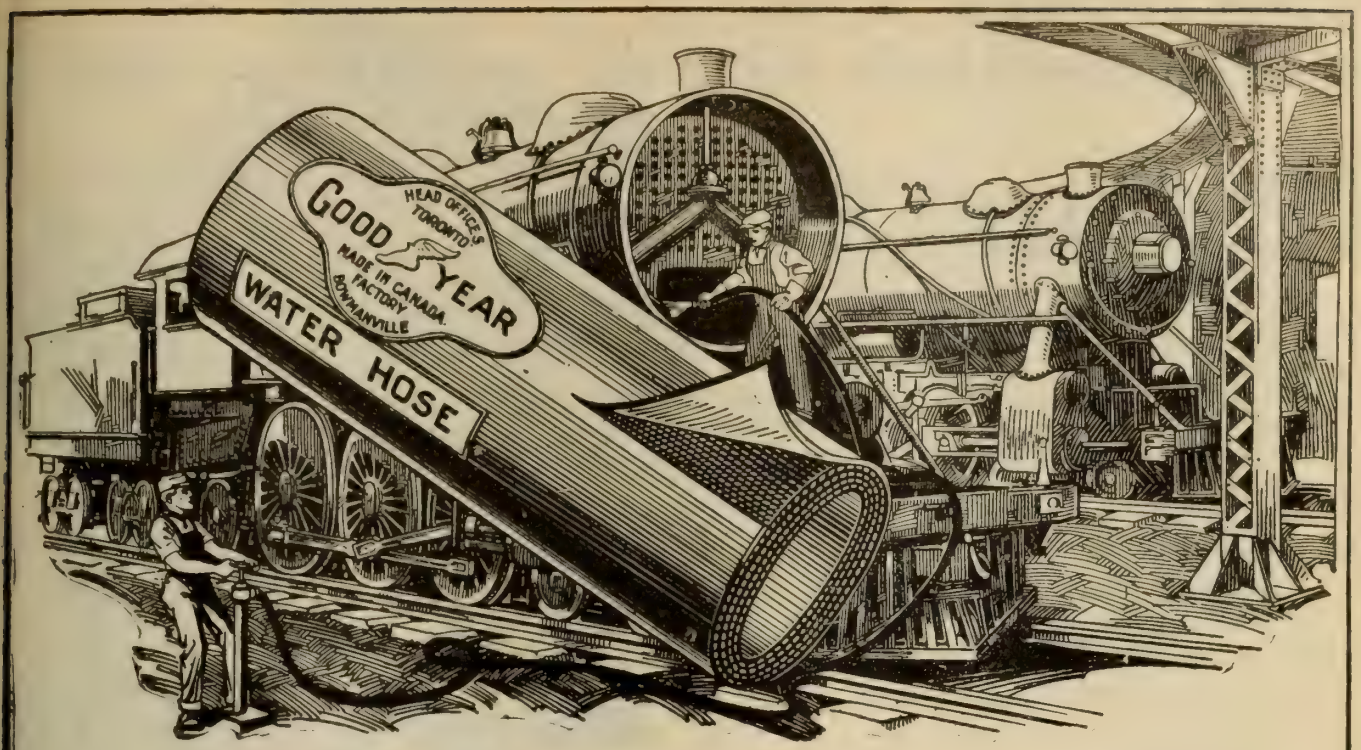
Williams' "Vulcan" Forged-Cutter Tool Holders



This Cover Reduces Costs *on Industrial Water Hose*

We never heard of industrial water hose bursting because of internal pressure. Any fairly good water hose will stand all the pressure it will ever get in industrial use.

But we have seen and heard of thousands of feet of water hose which had to be discarded long before its time because the *cover* wore through.

That fact guided Goodyear scientists in designing Goodyear Water Hose.

They started with a good inner tube and strong fabric.

But they put on this hose an unusually thick cover of exceptionally tough rubber.

Water Hose is dragged over floors and pavements and steel plates. It is walked on and run over by hand-trucks and wheelbarrows. It is left outside rain or shine. *The Goodyear cover on Goodyear Water Hose is built to stand this use.*

That is why Goodyear Water Hose wears longer and so costs less.

That is an example of the way Goodyear builds all Industrial Hose—

—finding out what conditions must be met, and then developing the materials and construction to meet them.

Goodyear has scientifically developed a hose for every industrial use. Samples of this hose, and the advice of a trained technical man, are yours for the asking—without obligation. Phone, wire or write the nearest branch.

Notes On Grinding

NORTON COMPANY WORCESTER, MASS.

No. 53A

OPERATING SPEEDS FOR SNAGGING CASTINGS

GENERALLY SPEAKING, the correct speed for grinding wheels in snagging castings is between 5,000 and 6,000 surface feet per minute. This is fairly well established and quite generally accepted by the manufacturers of grinding wheels. This range was determined partly by years of experience and partly by physical laws and the desire for an adequate factor of safety. All snagging wheels made by reliable manufacturers are subjected to a speed test just before they are packed for shipment that generates a centrifugal stress many times in excess of the stress prevailing under the recommended operating speed. In the case of the Norton Company, this tested factor of safety runs from 2¼ to 3¼. This, then, is the first limiting factor to wheel speed.

Furthermore, it has been shown that there is no appreciable gain from faster speeds; at least, not enough to offset certain drawbacks. It should be further remembered that the grinding wheel is made to operate at approximately the recommended speeds and any appreciable deviation calls for adjustments that are not always easy to make nor are they conducive to efficiency.

It is necessary to keep the speed of the grinding wheel approximately within the recommended range, if its productive capabilities are to be maintained. It has been demonstrated that if a wheel's speed is allowed to fall to a very low level, or if it is speeded up beyond a certain point, reduced cutting ability for the same amount of effort expended is the result. In the case of a sub-normal wheel speed, not only does the productive capacity fall off, but there is excessive wheel wear.

To illustrate this point, let us consider the case of an 18-in. wheel, grain 10, grade U Alundum, for snagging steel castings. At 1,175 revolutions per minute its peripheral speed is 5,500 surface feet per minute, and it cuts and wears satisfactorily. If the revolutions remain the same, at 11 inches diameter, the surface speed is 3,500 feet. What is the result? Every cutting grain on the face of a revolving grinding wheel has a definite amount of energy stored up in it. It is the expenditure of this energy that enables the grain to do useful work and remove metal. Now the energy available varies as the square of the surface speed. Therefore, at 11 inches diameter, the cutting grains deliver only 40 per cent. of the energy that they did at 18 inches diameter and they cannot be expected, therefore, to grind as rapidly. Also, because of the decreased energy it is less capable of withstanding the resistance offered by the steel and hence is more readily torn from its setting. This, then, explains the difficulty that will be encountered in attempting to grind at very low surface speeds.

In order to keep this same wheel operating at highest efficiency, the wheel speed should be increased at about 13 inches to 1,700 revolutions per minute. By doing this the surface speed as the wheel wears from 18 to 13 inches varies from 5,500 to 4,000 surface feet per minute, and in wearing from 18 to 9 inches the variation is from 5,700 to 4,000.

If this same 10 grade U Alundum wheel was giving satisfaction at 5,500 surface feet per minute, and an attempt were made to speed it up to 7,000 surface feet, no greater production would be realized. This is due to the glazing effect resulting from the increased duty imposed on each abrasive grain.

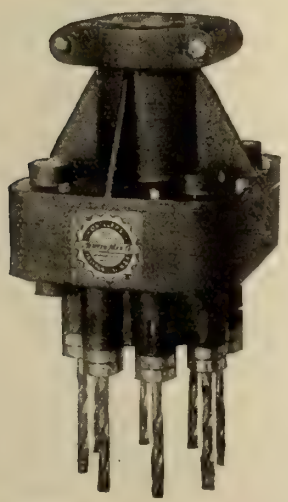
2 Minutes or 20?

This Is The Vital Question



Do you drill ten holes in the time it takes for one? The Hoefer Auxiliary Head equips any driller so as to accomplish this big saving in time. It speeds up production in drilling tremendously. Not only do you save the drilling time, but also the time now lost in shifting the jigs and raising and lowering the spindle for the extra holes.

Hoefer Auxiliary Heads are made in any multiple, arranged in any manner, from 2 up. They are made by expert tool makers and unqualifiedly guaranteed to handle accurately the work for which they are designed.

Investigate now—every day you use a single drill where the multiple may be used you are paying for an auxiliary head through increased costs, but not securing its benefits.

Write for catalog. Send a blueprint of some of your work for estimate of time and cost.

Broaching as an Aid to Greater Production

The Second of a Series on This Subject. The Combinations Used in the Production of Broaching Work, Together With Views of Various Types of Broaching Machines, Are Described Herein

By FRANK H. MAYO

HAVING described in the previous section of this article some of the details and variations of design incident to broaching, a few illustrations showing combinations used in the production of broached work are here shown, also various types of broaching machines are shown, of which Fig. 14 illustrates a draw broaching machine of the type commonly employed for pulling a broach through the work. This machine is made in a number of sizes, and operates horizontally in the following manner:

A nut A is caused to revolve forward and reverse by means of gears and clutch, and this nut draws the screw B transversely forward and back; at C, a tool slide is attached to the screw, and to this slide the broaches are attached. The work is held against the face plate D, or in a suitable fixture, and the broaches, operating through this plate, broach the work inside or on the outside, as the case may be. On some types of broaching machines, in place of a nut and screw, a rack and pinion are used to draw the broach; the principle involved in such a construction is illustrated by Fig. 15, where the pinion A, travelling forward and reverse, operates the rack B, which has attached to it at C a tool slide. By the use of either

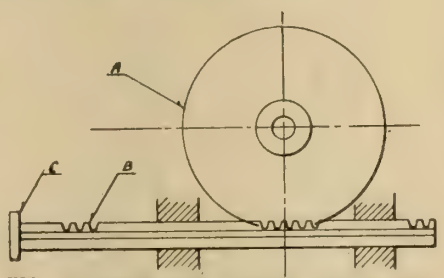

FIG. 15—RACK AND PINION DRIVE FOR BROACH

of these machines, the broaches are drawn slowly through the work at the proper cutting speed, and a quick return for the same is provided by the gearing and reversing mechanism. It is claimed for the screw-and-nut arrangement, that it is smoother acting than when a rack and pinion are used, and the screw and nut is the construction most universally employed.

In Fig. 16, a type of machine used for cutting keyways is illustrated. This is a vertical-stroke machine, and works more on the principle of a slotter. The work is held on the upper plate A, while the cutter bar B is operated from below by suitable reciprocating mechanism.

A very cheap machine often resorted to for an occasional job of broaching on small work is the arbor press, and Fig. 17 shows a small bench press where the work is held on A, either in a fixture or not, while the broaches, which are usually short, are pushed through by the ram B, which is in turn operated by the lever C attached to a pinion that meshes in a rack on the ram. This illustrates the principle of push broaching, whether it be carried out on a punch press, hydraulic press, or any common type of press.

A small horizontal push broaching machine, having a screw and nut as the operating medium, is shown by Fig. 18. This takes the form of a bench lathe, the work A being gripped in a chuck B, which is held to a stationary spindle; this spindle has a hole in it, through which the broaches pass. The broaches

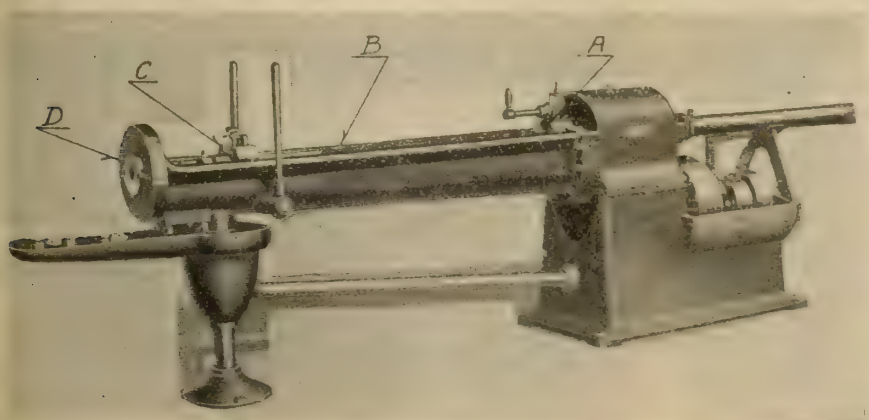

FIG. 14—BROACHING MACHINE USED FOR DRAW BROACHING.

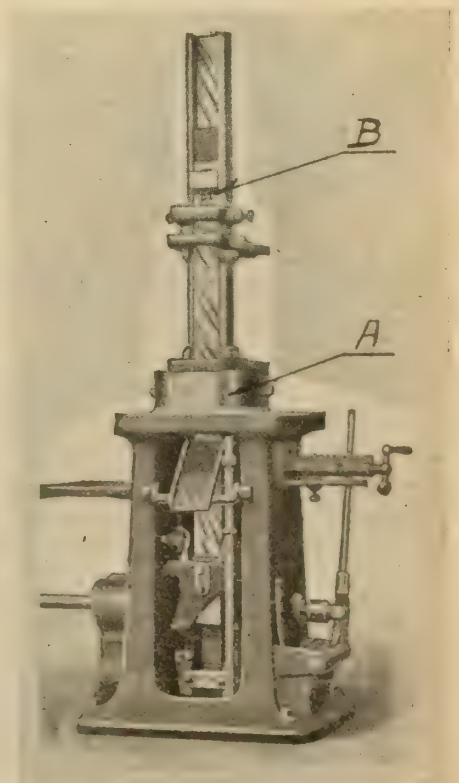

FIG. 16—VERTICAL TYPE OF MACHINE USED FOR BROACHING.

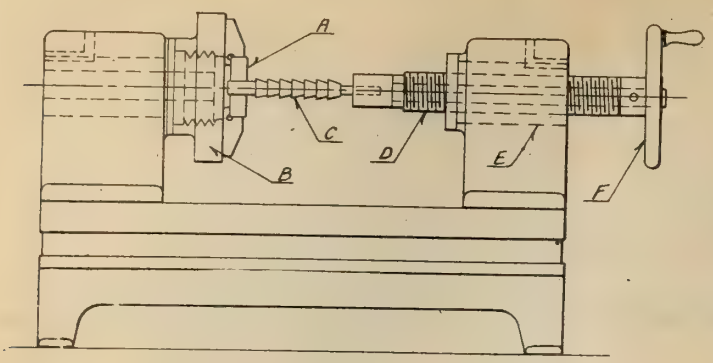

FIG. 18—SMALL PUSH BROACHING MACHINE.

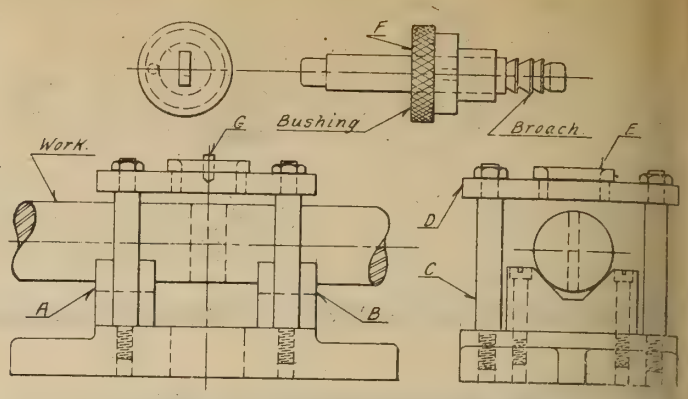

FIG. 19—FIXTURE FOR PUSH BROACHING RECTANGULAR HOLE.

C are pushed through the work by the screw D operating in the fixed nut E, a handwheel F being used to revolve the screw.

Fig. 19 shows a fixture that was used on a press for push broaching, an elongated hole which passes through a round bar, and also illustrates the type of broaches and guide bushings used in this connection. Referring to the illustration, the work is held between two vee blocks A and B, no clamps or other means being used to hold it in place. Four studs C carry a plate D, which contains a fixed bushing E. Slip bushings F, containing different sizes of broaches, are successively put in place in the fixed bushing E, and these broaches have short pilots on them which enter the work and locate it in line with the bushing. This hole is first drilled out and the broaches trim the sides and square the corners of the hole. To locate the slip bushings in the proper radial location, a pin G is provided, which enters a hole in the slip bushings. These broaches have three cutting edges, and the upper portion is a slip fit in the bushing.

For cutting vee slots in the outside

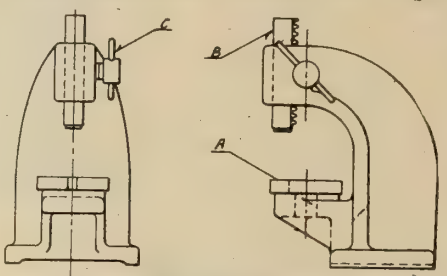

FIG. 17—ARBOR PRESS SOMETIMES USED FOR BROACHING.

of a round piece, a built-up broach, such as that shown in Fig. 20, may sometimes be used to good advantage; this broach is used on a press in connection with four others. The two vee-shaped slots in the work run by the neck, the broaches A are held in a suitable holder B, and the work is pushed through the broaches by the ram of the press. The views at the right of Fig. 20 show how a number of discs (five in this case) are fastened together by screws and dowels, each disc being backed off to form a tooth, thereby making a progressive broach. In the view showing the work in place, the broach illustrated is of the plain type, and would have but one cutting edge, and by comparing this with the built-up type, the advantage of the five cutting edges over the one is readily apparent.

Another feature sometimes incorporated in this style of external broach, is a recess at the upper end, to act as a pilot when starting the work through the broach. In connection with broaching practice, the tables of splines, Figs. 21, 22 and 23 are of interest, also the table

T = 1000 X 6 X Mean R X h X l = INCH-POUNDS TORQUE CAPACITY PER INCH BEARING LENGTH AT 1000 LBS. PRESSURE PER SQUARE INCH ON SIDES OF SPLINES. NO ALLOWANCE IS MADE FOR RADII ON CORNERS NOR FOR CLEARANCES.

FIG. 22—TABLE OF S.A.E. SIX SPLINE FITTINGS.

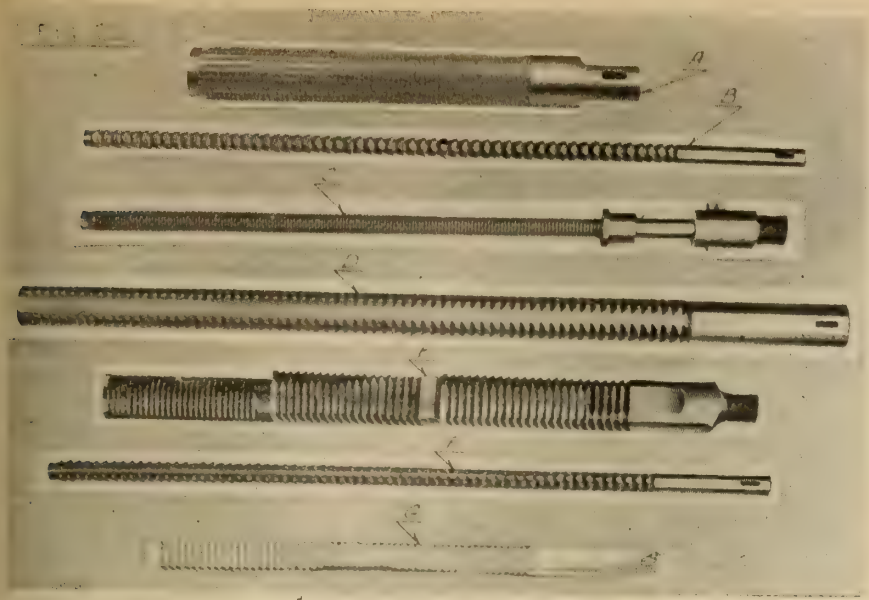

FIG. 26—ILLUSTRATIONS SHOWING VARIOUS TYPES OF BROACHES.

of squares, Fig. 24. These are the Society of Automobile Engineers standard practice, and broaches for cutting the same are carried in stock by some broach makers. In Fig. 21, it will be noticed that the table gives dimensions for four splines to "permanently fit" on shaft and "to slide when not under load," while the tables, Figs. 22 and 23, give three styles of fit. The table of squares, Fig. 24, gives sizes for "permanent fits," and also for "slip fits."

On draw broaching machines, the tool slide is a very important unit, as it must be very substantially made, and a view of a tool slide is shown by Fig. 25. This illustrates the method of gripping the broach-holding units, which were shown in the first part of this article; this is taken care of by threading them into the sliding block A, which is adjustable, to bring the broach in the proper relation to the work by means of the screw B; a square-headed screw C locks the broach holder, and this illustration shows a split broach holder D in position. Two slots E, one shown and one at the opposite side, fit over slides on the machine and prevent the screw of the machine and slide from turning, while at the same time supporting the slide and broach contained therein. The lug F, which carries the plug G, is so located that it engages with trips which control the travel of the screw on the machine.

A typical group of broaches of varied design are illustrated by Fig. 26, the upper one of which is of the type commonly employed to broach internal gears, it being indicated as A and shaped like a spur gear with teeth increasing from nothing to the full depth of the gear tooth spaces; at B a broach for a hexagonal hole is shown; C illustrates a broach for a round hole to replace a reamer; D is a large square broach; E is a special broach for forming an arc; F is a grooving broach of the type used for cutting splines; while the lower broach G is for finishing a rectangular slot. Broaches of the latter type are frequently made with the teeth on opposite sides, sloping diagonally opposite, as this makes a stronger tool, with the advantage of a shear cut, more teeth are thus working at the same time, and the angles should be so made that they neutralize the side thrust on the broach when cutting.

across flats required at both ends; this forms a bearing for the work on the plug, as it is successively indexed about the same.

An example of broaching out a sliding gear is shown by Fig. 28. In this instance, it is necessary to remove considerable metal at both sides of the key portion, as indicated at A. To accomplish this, the work is held against the face plate of a draw broaching machine in the usual manner while a long broach is pulled through it, and a section through this broach at three points are shown in the upper row; the first section shows the round shank of the broach through the groove of the first tooth; the next section shows how the teeth are nicked at B to break the chips; while the last section shows one of the finishing teeth, where it will be noticed flats have been cut across the broach grooves to provide additional chip room, as the finishing teeth not only cut out between the key portion of the work but also trim the sides of the same.

By referring to Fig. 29, an idea may be had of the construction of a broach holder for cutting six keyways at the same time. This is held to the tool slide of the machine in the usual manner, and the holder portion A has slots cut in it to receive the broaches B, while a ring C forced over the holder contains six screws D, which securely hold the broaches in place, the broaches being made with a hook shape at X so the pull of the cut will come against solid metal.

In the final section of this article, examples of spiral and group broaching will be shown, which, together with what has already been said, forms quite an extensive description of the broaching practice, which for quickness of results is rivalled only by the punch press the chief disadvantage of broaching being the first cost of the tools and the uncertainty incidental to the length of time they will stand up on the job.

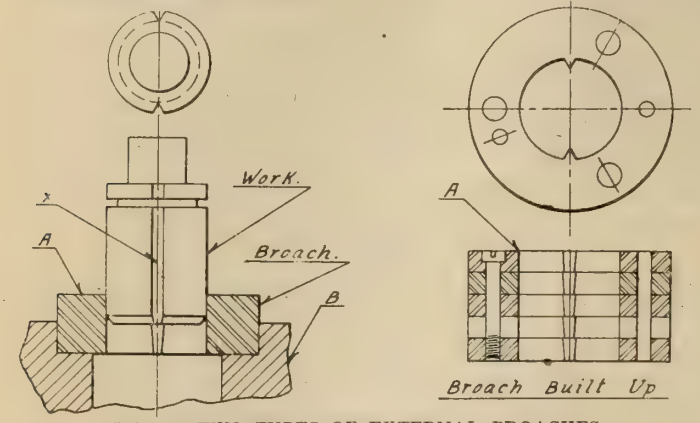

FIG. 20—TWO TYPES OF EXTERNAL BROACHES.

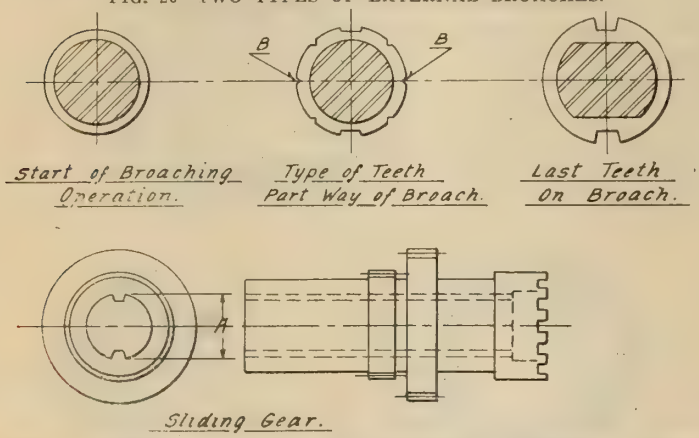

FIG. 28—EXAMPLE OF WORK AND SECTIONS OF BROACH TEETH.

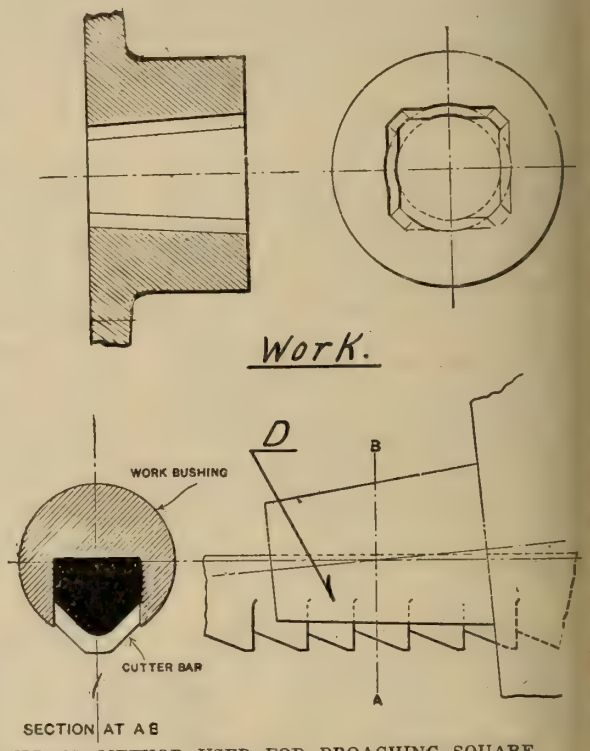

FIG. 27—METHOD USED FOR BROACHING SQUARE TAPERED HOLE.

of broaching practice are listed broaching keyways in a tapered hole and broaching tapered square holes. Referring to Fig. 27, this shows an example of work broached with a tapered square in it, while below, the method of holding the work for this operation is shown. It will be noted in this connection that the work is held on an angle, so as to bring the line D parallel with the screw of the machine. To machine, by broaching, this tapered hole, it is necessary to provide an indexing fixture arrangement so the work may be indexed four quarter revolutions, thus alternately bringing the four corners of the work in the correct location, so that when the broach, which is made to trim out the corners and part way across two sides, is drawn through four times, the holes will be completed. The general practice in this connection is to have the work supported by the round-tapered plug in a hole reamed slightly larger than the distance

The Chemical Products Corporation Ltd., Toronto, are considering the erection of a plant in Belleville at an estimated cost of $1,000,000.

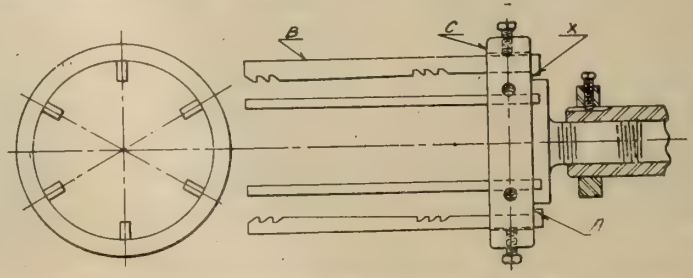

FIG. 29—HOLDER AND BROACHES FOR CUTTING SIX SLOTS.

What is the Mechanical Engineer's Position?

Some Excerpts From an Address Read Before the Institution of Mechanical Engineers on Administration and Organization, With the Danger of Further Encroachments Upon Their Established Position in the Engineering World

By EDWARD HOPKINSON, D. Sc., President *

[F we are to maintain, or perhaps I should say if we are to prevent, further encroachments upon our stablished position in the engineering orld, mechanical engineers must give ore attention to the administration and rganization of workshops. We have mitted to realize that to make an efficient machine is one thing, but to make t efficiently another thing. . . . The xigencies of war have taught us much, nd have, I think, brought to the fore a onsiderable number of young engineers f natural administrative and organizng capacity. But administration and rganization cannot be left entirely to atural aptitude, even when combined ith long experience. There can be ittle doubt that in the future our shops nust be managed by younger men, of nore limited personal experience than as been customary hitherto, who will herefore need to rely to a greater exent upon the experience of others, acquired through reading and lectures. These questions of management and organization are vital matters which ought not to be left to chance, and should form part of the specific training of a mechanical engineer. . . . The war has changed the outlook of the works manager. He has begun to realize that the man who has the advantage of wide reading and of thorough technical training, provided he has a natural practical bent, may make a far better under-manager than the man who has not these advantages, but has spent a much longer time in the workshop.

One reason which has militated against the more rapid absorption of the product of the technical schools as an integral part of workshop organization is to be found in the fact that too little time is given in the schools to teaching the art of production. The right use of tools and the accommodation of design to the methods of manufacture and to the tools available receive too little attention. Many lectures are devoted to the design and working of a dynamo or steam engine, but few to that of a lathe or milling machine. How often are parts of scientifically correct design incapable of being moulded economically in the foundry or tooled economically in the shop?

Our institution has an important part to play in this respect. Much can be done by encouraging the reading of papers which deal with workshop organization and with production from tools. There has been already a noticeable increase in papers of this character, and I hope it will continue. I do not agree that the discussion of these problems will tend towards advertisement, lower the general scientific status of the papers, or emphasize unduly the purely commercial aspect of works production. A description of the means adopted by a works manager to obtain maximum production of the required degree of accuracy at minimum cost is as important to the progress of mechanical engineering as the description of a new invention.

There is another side of engineering at which it is too often the custom of engineering institutions to look askance, namely, that concerned with the distribution and selling of the product. In most industrial engineering undertakings the commercial section of the staff is larger than the designing, testing, and foreman section, and it is just as essential to the highest success that it should be composed of trained engineers. A very large proportion of the men who enter engineering works with the intention of fulfilling their calling in constructive work find that they are drafted, through the force of circumstances, to the commercial side, and develop their careers in that direction. No salesman of high-class engineering products can be altogether successful unless he has the engineering instinct and has had a sound engineering training. The successful engineer-salesman must be able to understand and enter into the wants of the purchaser and suggest means for satisfying them. He must also understand thoroughly the properties and capabilities of what he has to sell. It is a common, though erroneous, idea that a man ceases to be an engineer when he becomes involved in the commercial side of engineering. On the contrary, it often happens that in discharging his commercial duties he is using to the best advantage his engineering knowledge and aptitude. . . .

Whatever may be the steps taken to widen the curricula for engineering students, it is essential that those occupied in administrative duties should recognize that successful administration is based on principles which are capable of definition and of scientific treatment and analysis, that the accumulated experience of others can be put into a form in which it can be taught and learned, and that those mental and moral characteristics which are essential in the good administrator can at least be developed, if not implanted by training.

We must not, however, be content with teaching only those who are to administer our works and factories. We shall never get the best out of any system of organization or administration in any field of work unless the workers themselves understand the principles upon which the system is based. A wise manager in an engineering shop will make no changes without first explaining their object to the workers, probably through the medium of the Works Committee. A still wiser manager will so develop the interest of the workers in efficient administration that proposals for improvement originate with them, and they thus assume the position of having to prove their case. With this in view, it is most important that there should be evening classes in administrative subjects in our technical schools.

Largely due to the experience gained during the war, the need for systematic instruction in industrial administration has been so prominently forced on the attention of those responsible for the conduct of some Lancashire engineering and other industries, that a year ago six firms combined to make an offer to the Manchester Municipal College of Technology to provide an annual sum for the establishment of a special department for this purpose. The department has been constituted and is worked in close co-operation with an Advisory Committee of those who are themselves engaged in works administration. A director has been appointed with three assistants. . . .

The material side is only one part of works administration; not less important is the purely human factor All that pertains to the physical health and mental contentment of the workers is reflected in the efficiency of their work. The most important problems in the human side of administration are those connected with industrial fatigue. The efficiency of a man as measured by his capacity for output is dependent upon his hours of work, both in length and distribution, and the integration of the curves connecting rate of output with time of work will show the maximum amount of work which can be obtained from the individual. The investigation of these questions on a scientific basis is of a peculiarly difficult nature on account of the large number of independent variables which affect the result. But notwithstanding the difficulties which surround investigation, I

*Owing to the illness of the President, the address was read by Mr. Michael Longridge, immediate past-president. October 24th, 1919.

am convinced that discussion of the deductions drawn from systematic observation by the physiologist and the psychologist, combined with the inductive conclusions of the works manager, will yield most valuable results. . . .

The right and economical use of the human labor working a tool has given rise to another line of investigation in workshop administration known as "time and motion" study. A "best" way can be found of performing any operation dependent upon muscular effort by methodical and scientific study of the various motions involved.

Though the actual application of such principles can only be carried out in the workshop and gauged by practice there, the importance of their study and the methods of studying them may well be taught at school or college. Our public schools take infinite pains to teach boys how to get the most out of a cricket bat or an oar with a given amount of muscular effort; coaching in rowing or cricket is acknowledged to be essential, why should not our young engineers have similar coaching in the multifarious manual operations of an engineering shop? The analogy of our organized school games also suggests that the interest of the worker may be enhanced and sustained if he is treated as a member of a team playing for a definite goal. "Team work"—that is, the combination of individual effort to achieve a definite result—ought to be developed to a much greater extent than hitherto in our workshops, and must increase efficiency and improve discipline.

Attention has recently been drawn to another psychological aspect of the labor question in engineering workshops where modern conditions are unfavorable to efficient work compared with those that obtained in earlier days. In the old days a millwright employed, for instance, in the setting out of a main gear for driving a mill, himself drew it out on the drawing floor, received the wheels from the foundry and set them out for tooling, and finally was usually selected to erect and set to work. From beginning to end of his job he had a clear idea of the ultimate use to which his work would be put, and was largely responsible for it until put into operation. Such incentives have necessarily disappeared under modern workshop conditions, but probably much may be done, even under the stifling conditions of modern repetition work, to impart to the workman a fuller knowledge of the ultimate object of his labor and so to engender a keener interest therein.

Production

Though the more far-sighted leaders of public opinion, both among employers and employed, now realize that only by increased production can we recover from the losses and damage of war, recent events too clearly prove that this truth has not yet permeated all classes of the nation. It has been thrust into the background by the demand for the establishment of a higher plane of living for the working classes without consideration of the means whereby it can be obtained. Every step in increasing consumption can only be achieved by increasing production in a much larger ratio. It is too often popularly assumed that the higher remuneration of labor will by itself secure an industrial Utopia, and that labor, if it has more to spend, will be able to satisfy its desires. Experience has shown that the very contrary is the fact. Mere increase in wages, mere changes in the distribution of wealth, have the effect in themselves, divorced from other influences, of providing less rather than more of the good things of the earth. It has been proved again and again from actual figures of most of our staple industries that a redistribution of the profits of industry, however desirable on other grounds, cannot in itself materially add to the welfare of labor unless it directly conduces to increased production.

If, as a nation, we are to realize what we all desire, a fuller and happier life for all classes of labor, every proposal for increase or change in the methods of remuneration of labor, every proposal for sharing or redistribution of profits, every proposal for change in control or in the management of industry ought to be subjected before adoption to crucial examination as to whether it will increase production per worker or can be accompanied by other changes in the conduct of the industry which will, in their combined effect, achieve the same object. Unless they satisfy this test we shall fail in attaining our end. Instead of promoting the welfare of the industry and of those engaged in it, we shall doom it to decay and ultimate extinction.

India

I have spoken hitherto solely of the home point of view with regard to reconstruction rather than of those wider considerations which apply to the Empire as a whole. In conclusion, I ask your attention for a few moments in connection with some matters which vitally concern us as engineers in one constituent part of that Empire—India, where the problems to be solved are not, as at home, those of reconstruction, but rather of construction.

Until a few years ago India looked almost entirely to Great Britain for the bulk of her engineering requirements, but we may expect that in the near future India will be in a position to rely less upon home engineering products, and will supply at least the simpler forms of these products from her own resources. I am not concerned now to inquire in detail whether this tendency will have a good or bad effect upon British engineering, but I may remark in passing that all industrial history shows that, although there may be hardships in certain industries in the process, the industrial development of one country, closely knit in its commercial relations with another, is to the ultimate benefit of both. . . . To promote the development of engineering industries in India is not generally in opposition to the best permanent interests of such industries at home, though it may entail temporary dislocation.

India has already laid the basis of an engineering industry in the establishment of two important and successful iron and steel works. The Bengal Iron and Steel Works under their present management have been established for some twenty-five years at Kulti, and have had a chequered career, during which, in 1903, an attempt was made to manufacture steel which proved unsuccessful, and was abandoned. The works are now most successful, both financially and in quality of product, turning out 10,000 tons of pig iron per month, about one-third of which is used in their own foundry for the manufacture of pipes, columns and pot sleepers and chairs. More recently the Tata Iron and Steel Works have been erected at Sakchi on the Bengal Nagpur Railway, about 155 miles from Calcutta, and in reasonably close proximity to their supply of coal and iron ore. The works were started in 1912, and have two large blast-furnaces in operation, each capable of producing about 350 tons of pig per day, a third nearing completion, and three more much larger in process of construction. Most of the pig is converted into steel. The rolling mills produce about 120,000 tons of rails and smaller sections yearly. About 13,000 men are employed in the works, adjacent to which a town having 50,000 inhabitants has sprung up, carefully planned in every detail with suitable houses, mostly provided with gardens, for all classes of employees, and schools, institutes, and hospital. These two works, even when extended, will not provide more than a fraction of the iron and steel India needs, of which the imports in 1913-14 amounted to over 1,250,000 tons.

At the present time India cannot roll a steel plate nor draw a steel tube; there are no rolling mills for tin-plate or for copper or brass sheets. Lead piping, galvanized sheets, steel wire, copper, and brass rods are not made in India, and no steel castings are produced except on a limited scale at some of the ordnance factories and in a few of the railway works. Even railway axles, carriage springs, wire ropes, and chains are imported. No steam engines of any size are constructed; probably the largest are those of some 400 h.p. for river craft. Portable engines, traction engines, and road rollers also are not made, nor steam boilers, except a few of very small capacity. Agricultural machinery, the greatest need of all in India, is not manufactured except to a limited extent in its simpler forms. Substantially no cotton or jute machinery, either for spinning or weaving, is made in the country. Locomotives cannot be built without obtaining many essentials from abroad, and shipbuilding is in its most elementary stage. Electrical machinery

f every kind is imported. Apart from ie railway workshops, the principal entre of general engineering workshops i India is Calcutta, but in 1915 there ere only twenty-seven of these with n aggregate of 12,000 employees.

Owing to the pressure of war condi- ons, the situation in respect of engin- ering industries is rapidly changing. he Tata Iron and Steel Company will hortly have a large plate mill at work or rolling plates up to 1¼ in. thick nd it is proposed to construct a wire ill and a belt and nut shop of large apacity. Works are to be erected for ie manufacture of tea machinery, which itherto has been entirely imported. chemes are in hand for the manufac- ure of agricultural implements in India rom Indian steel. Vacuum brake ma- erial, as required by the Indian rail- ays, is now being made in India. Gal- anizing is being carried on on a fairly irge scale by several companies. A irge workshop has been erected for the anufacture of jute mill machinery of ll classes, now entirely imported into ndia. Such are only a few of many in- tances of advance. . . .

There is as yet no base on which to uild elementary mechanical training for he Indian artisan. With a people lmost wholly illiterate, schools for the eaching of elementary mechanical sub- ects are useless for the ordinary boy, nd in those that have been started it s soon found that the first years must e spent in imparting sufficient elemen- ary education to enable the scholar to erive any advantage at all from voca- ional teaching. We must look to the orkshop itself, not only for training in he particular crafts, but also for such eneral elementary education and rudi- ientary technical education as are ecessary for the acquisition of crafts- anship. Although a man may become xquisitely skilled in the art of, say, arving ivory, or engraving brass, and emain entirely illiterate, depending pon hereditary genius in his craft, he annot become a patternmaker or fitter nless he can read and understand a rawing. Wherever schools in direct onnection with workshops have been et up, the results have been most sat- sfactory. If a class of artisan me- hanics is to be built up in India, every ngineering works, either alone, if of ufficient size, or otherwise grouped vith neighboring works, should provide school for teaching the boys employed oth general subjects and also such ele- ientary technology as is suited to the rade they are learning, and the teach- rs as far as possible should be drawn rom the foremen and others engaged n the works.

These engineering developments in ndia must have a marked effect on the rofessional status of engineers em- loyed in India which it is incumbent n us as members of the institution to vatch closely, and, where possible, to nfluence for the benefit of our own nembers in India and for the mainten- nce of high professional standards.

At the present time there are in India about 600 members of the Institution of Civil Engineers, 400 members of the Institution of Mechanical Engineers, and about the same number of members of the Institution of Electrical Engineers, besides members of various other bodies, such as the Institution of Naval Architects, the Iron and Steel Institute, and various mining societies. There are also undoubtedly many qualified engineers in India holding positions of responsibility who are not members of a home society. But India is a vast country, and these engineers are split up into little groups working in places separated by great distances and only aggregated to any extent in such industrial centres as Calcutta and Bombay.

The Indian Industrial Commission gave much attention to the various suggestions made to them by engineers in various parts of the country on this subject, and in its report advocated the foundation of a representative Society of Indian Engineers. It is obvious that conditions in India preclude the formation of individual institutions to represent the various branches of engineering, and that the objects of such a society could only be attained by combining all branches of engineering, whether civil, mechanical, electrical, mining, or R.E. The recommendations of the Commission have been actively taken up by engineers of all classes, and I am glad to say especially by our own members in India. The institution of such a society was decided on at a representative meeting held in Calcutta in December last under the presidency of Sir Thomas Holland. A committee was appointed to draft proposals for the constitution of the society and rules for its conduct and to consult all the various interests involved. I am informed that all the existing organizations have decided to cooperate in the formation of the new society, so that it will embrace and be representative of all professional engineering interests in India. It was at one time thought possible for the new society to be formed under the auspices of our leading home institutions, but for various reasons such a plan was not feasible, and I think it is generally conceded both here and in India that it is better that the Indian Society, knowing the wants of its own members and the local conditions, should devise its own constitution independently. At the same time, it is, I think, incumbent upon our institution to use its influence in maintaining a high qualification for membership in the Indian Society and to collaborate with it with a view to obtaining the benefits for our own members in India which such a society can provide.

SYNTHETIC CAST IRON

C. A. Keller, the French metallurgist and electric furnace expert, discusses and describes at considerable length the process which he elaborated before and during the war for the manufacture of synthetic cast-iron from steel turnings, etc.

Briefly, the process consists in melting the turnings in a specially arranged electric furnace, which he describes. There are two possible methods of producing the cast-iron: the carburizing medium can either be added to the steel in the molten state, or, as in the writer's process, the carbon is incorporated in the charge in the form of fine coke or charcoal, so that the process of carburization is continuous and gradual. The basic slag as added to the burden ensures desulphurization of the charge, if this is required, and at the same time diminishes the conductivity of the mass by the interposition of non-conducting materials with the conducting materials (turnings and carbon), thus enabling the process to be carried out at the tensions usually adopted in electro-thermal operations. Thus the cast-iron obtained in the presence of a sufficiently basic slag retaining the small quantity of silica introduced, contains practically all the material composing the burden, excepting the sulphur, without increase of silicon, and the carbon of the charge is used only for carburization, and has no appreciable effect on the silica.

As an example of what may be achieved by the method, from steel turnings containing:

Si	0.44 per cent.
Mn	0.55 per cent.
S	0.07 per cent.

a white cast-iron giving the following analysis has been obtained:

C	3.55 per cent.
Si	0.52 per cent.
Mn	0.48 per cent.
S	Trace.

The mechanical properties of cast-iron obtained by the writer's process have been very satisfactory.

As regards the economy of the process, the writer states that the consumption of electrodes may be reduced to 6 kg. per ton, provided they are of good quality. The consumption of non-oxidized steel turnings is 1,050 kg. per ton of cast-iron, this figure increasing to 1,100 kg. with fairly oxidized turnings. The quantity of coke containing 80 per cent. of fixed carbon required for obtaining a ton of extra-high strength cast-iron containing 3 per cent. carbon and 1.75 per cent. silicon, using ordinary steel and shell-turnings, is about 80 kg.

Several new plants were laid down by the writer's firm during the war and they attained a very high degree of organization, supplying cast-iron to outside firms also. The detailed arrangements of this lay-out and of the patented furnaces used are given in the original article.

The future of the synthetic method of manufacturing cast-iron will depend of course mainly on the quantity of raw material available, as well as on the possible extensive application of hydro-electric energy for the purpose.—Bulletin de la Societe de l'Industrie Minerale.

The Use of Abrasive Wheels for Metal Cutting

Abrasive Wheels Are Now Recognized as an Ideal Medium for Removing Metal in Quick Order. Some Practical Hints Are Given Herein on Selection and Proper Mounting of Wheels, Etc.

By EDWIN L. MONK

THE use of abrasive wheels for the purpose of cutting and shaping metal and other hard substances has of late years gained favor to a remarkable extent, both with large and small engineering shops. The reason for this development is not difficult to discover when we consider that rapid production and economy in labor are two factors which are of the utmost importance to the success of any business undertaking.

The following table shows the relative percentage weights of cast iron, wrought iron, steel, and brass removed by ordinary hand processes as compared with that removed by a grinding wheel in the same period of time:

	Emery wheel.	Hammer and chisel	File	Wastage of-emery wheel.
Cast iron	100	30	4.6	9
Wrought iron	100	26.2	6.9	34
Steel	100	2.7	1.8	53
Brass	100	7.5	3	24

A good grinding wheel should cut freely and not glaze or fill up with particles of the material it is cutting. The work when grinding operations are complete should be smooth.

The Proper Wheel

The actual selection of a wheel for any particular class of work can generally be left to the manufacturer. When sending an inquiry a piece of the material it is desired to grind, and also, if possible, a sample piece which has been actually ground will be of great assistance in enabling the suppliers to select the most suitable grade of wheel for the work required. The inquiry should also state the diameter and width of the wheel. If the shape is irregular, but is a standard manufacture and can be found in the manufacturer's catalogue, then the list number will be sufficient; if not a standard, then a rough dimensioned sketch should be supplied. The exact diameter of the arbor on which it is proposed to mount the wheel must also be given, and the hole in the wheel should allow a comfortable sliding fit. The correct clearance allowance can be left to the manufacturer.

If it is found impossible to send samples as suggested, then a description of the kind of material to be ground, stating whether rough or finished work is required, should be included in the inquiry, and in any case whether samples are sent or not it should be stated whether the work is to be applied by hand or automatically, and whether it is proposed to use the side or the periphery of the wheel, also some idea as to the kind of surface, whether flat, irregular, or cornered, should be given.

Users who wish to make their own choice of grade may be guided by the following considerations: The coarser the grit and the softer the grade, the more rapid will be the cutting effect. On the other hand, by using a fine grit and a hard grade the total amount of work performed by a wheel is increased, whereas for high finish a fine grit and soft grade is necessary. Heavy work calls for a harder wheel than light work. A harder wheel must be used for corners and edges than for surface work. The wheel must be softer as the contact surface increases.

Three materials are chiefly used in the manufacture of grinding wheels, emery, corundum, and carborundum, Emery is a mixture of corundum and hematite, and contains impurities to the extent of about 40 per cent., which are, of course, useless as cutting agents and cause undue heat.

Corundum is far superior to emery as its impurities only amount to about 4 per cent. of its composition, giving a cutting efficiency of anything from 30 to 100 per cent.

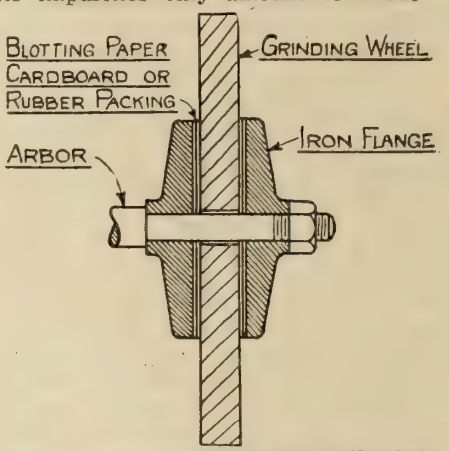

FIG. 1—ILLUSTRATING THE MOUNTING OF WHEEL.

Carborundum is composed of 30 parts by weight of carbon to 70 parts of silicon, and will easily cut either corundum or emery. Carborundum is an artificial abrasive, and is produced by means of an electric furnace. It is very brittle and practically infusible.

Grinding wheels are manufactured in various degrees of hardness to suit the particular class of work for which they may be required. The varying degrees from soft to hard are usually denoted by letters of the alphabet, and are known as grades. The grade of wheels is obtained by varying the amount of bond. If an increased amount of bond is used the particles of the wheel are not so easily broken, and it is consequently graded as hard; if, on the other hand, less bond is used, the grade will then be soft. The actual size of the abrasive grains are sorted out and are numbered after they have been passed through sieves, each having a varying number of meshes per square inch. For the ordinary purposes of manufacture the grade range from about 8 to 100; for special purposes, however, finer grades can be procured.

Proper Mounting of Wheels

We now come to the question of mounting the wheels on the machine and this is a matter over which great care should be exercised. Flanges should be used to support the wheel on each side, and in the case of large wheels the size of the flange should be from one-half to two-thirds the diameter of the wheel. As the wheel gradually wears down the flanges should be replaced by a pair of smaller diameter. Rubber, cardboard, or blotting paper washers must be used between the flange and the wheel and care should be taken to ensure that the wheel is not a tight fit on the arbor there should always be a slight clearance to allow for expansion of the arbor which may become heated when running and so cause the wheel to burst. The flanges must not be tightened up too much, not more than is necessary to prevent the wheel from slipping on the arbor. Fig. 1 shows the correct method of mounting a grinding wheel.

Sometimes a new wheel may get cracked in transit and the defect may be quite invisible, so that it is always advisable to ascertain that it contains no flaw. If a perfect wheel is gently tapped with a small hammer, it will produce a clear ring, whereas if it contains a flaw, then the sound it emits will be dull and dead. Wheels which are found to be defective should not under any circumstances be mounted.

For wheels of average thickness the following size arbors will be found to be amply strong enough: ½ in. diameter arbor for wheels 6 in. diameter or less; ⅝ in. for 8 in. diameter; ¾ in. for 10 in. diameter; 1 in. for 12 in. diameter; 1¼ in. for 14 in. diameter; 1½ in. for 16 in. diameter; 1¾ in. for 18 in. to 20 in. diameter; 2 in. for 22 in. to 24 in. diameter; 2¼ in. for 24 in. to 26 in. diameter; 2½ in. to 3 in. for wheels 26 in. diameter and over.

If the wheels are extra thick, then the sizes of the arbors should be increased in proportion.

The correct peripheral speed of grinding wheels in order to obtain the best results for ordinary purposes may be taken as from 5,000 to 5,500 ft. per min. Sometimes on large wheels 6,000 ft. per minute may be reached. A good practical method of obtaining the correct speed is to first run the wheel at a high speed and then gradually reduce it until the

*From "Practical Engineer."

wheel just begins to crumble; the most efficient speed will be slightly above "crumble speed." When the correct peripheral speed has been ascertained for any particular wheel, it should be maintained at that speed in order to obtain equal efficiency. This, of course, means that as the wheel wears down the revolutions per minute at which the machine is running must be increased. This may most conveniently be done by means of some variable-speed device, of which there are several on the market, or by means of cone pulleys. A less satisfactory way is to change the driving pulleys. The objection to this, of course, is that the speed variations can only be obtained in steps, intermediate speeds being impossible.

Operators often complain that wheels appear to be softer towards the centre, the real cause of the trouble being that the speed has not been varied in proportion to the wear of the wheel.

On no account should a wheel be run at a greater speed than that recommended by the manufacturer. The great danger and risk in doing so lies in the fact that the stress due to centrifugal force does not vary in direct proportion to the speed of the wheel, but as the square of its velocity; which means that if the speed is doubled, the stress due to centrifugal force will be increased four times. For instance, a wheel travelling a peripheral speed of 5,000 ft. per minute sets up a stress of about 75 pounds per square inch. At the factory wheels are usually subjected to a test of 9,000 ft. per minute peripheral speed, the test being carried out under special conditions, proper protection being afforded against breakages; at this speed the strain due to centrifugal force is about 250 pounds per square inch.

In order to ascertain the necessary revolutions per minute of any particular-sized wheel to produce any desired peripheral speed the following formula will be found useful:

$$\text{R.P.M.} = \frac{\text{Peripheral speed in feet per min.} \times 12}{\text{Diameter of wheel in inches}}$$

In order to make this quite clear, we will take a specific example and assume the wheel to be 26 in. in diameter, and that we wish to obtain a peripheral speed of, say, 5,500 ft. per minute. Applying our formula, we get

$$\text{R.P.M.} = \frac{5500 \times 12}{26 \times 3.1416} = 806$$

The table following will be found useful.

Wheels of cup shape should not be run faster than 3,000 to 4,000 peripheral feet per minute unless they are specially supported, but ring wheels carried in chucks can be run at ordinary speeds. The use of water on grinding wheels limits their speeds to about 3,500 peripheral feet per minute, as above this speed it will be found impossible to keep the water on the revolving surface. Wet grinding is used to-day to a far greater extent than might have been expected, judging by the prejudice that existed some few years ago. Up-to-date machines and improved water arrangements have to a great extent been responsible for the development which has taken place in this class of work.

It is most important that grinding wheels should be kept perfectly true, not only on account of better working efficiency, but also to ensure safety in working. Trueing up wheels is done by means of a wheel dresser or a diamond. A wheel dresser consists of a series of toothed wheels the teeth of which are sharpened to a knife edge. These wheels which are made out of hardened steel, are mounted side by side on an arbor, which is carried on a fork provided with a handle. This tool is held firmly at such a distance from the edge of the revolving wheel, so that any prominent parts may first be removed; when this is accomplished, the dresser can be brought gradually closer until the wheel is turned perfectly true.

Diamond dressers consist of a steel bar, which is sometimes provided with a handle, the cutting diamond being mounted at the other end of the steel. The diamond tool is used in exactly the same way as the wheel dresser. When dressing a wheel it is not absolutely necessary to alter the speed, but when using a wheel dresser it is certainly advisable to reduce the speed to about half normal working speed, and the use of water will prevent heating of the cutters and dust.

Certain grade wheels are specially made for individual classes of work, and if a wheel should fail to give satisfaction it will often be found that the cause is not the wheel, but that the purpose for which it is being used is not that for which it was supplied; or, again, the speed may be wrong. The best results cannot, of course, be obtained under such conditions, which more often cause glazing of the wheels and heating of the work. Grease and oil should be carefully kept away from wheels. Heavy machines mounted on a solid foundation are very desirable in order to eliminate vibration as much as possible. The rests should be properly adjusted so as to prevent any chance of the work getting wedged between the rest and the wheel.

In modern works, where several machines are kept more or less continuously employed, it is very desirable that proper provision should be made for the removal of the dust, which in most cases is very detrimental to the health of the operators of the machines and to those employed in the shop. There are several firms of ventilating and heating engineers who specialize in this particular branch of work and who are usually

Dia. of wheel in	R.P.M. for surface speed of

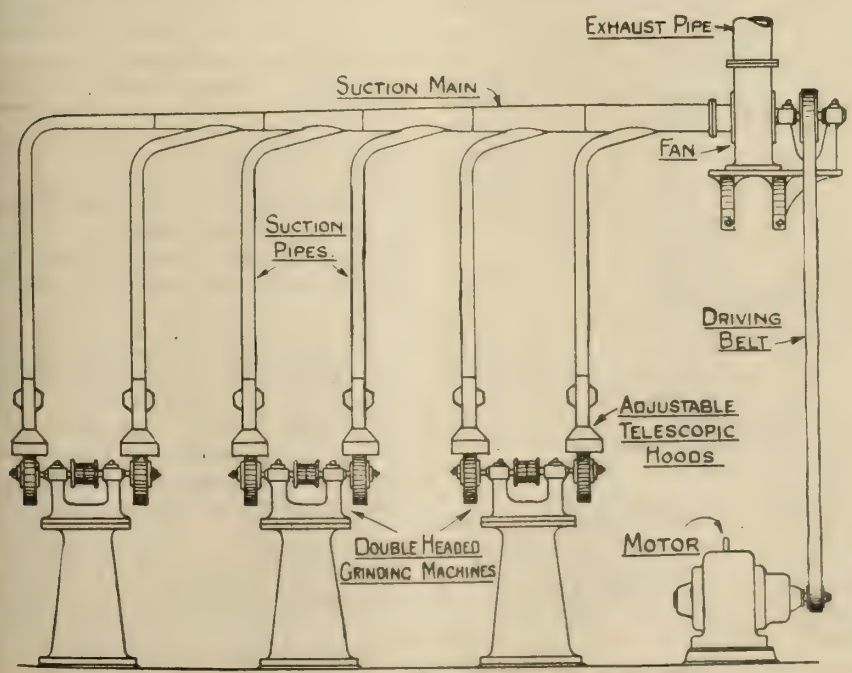

FIG. 2—APPARATUS FOR REMOVAL OF DUST, ETC.

glad to submit plans and quote for schemes to suit individual conditions. Fig. 2 shows a typical plant arranged for extracting the dust from three double-headed grinding machines. Dust-extracting plants of this description usually consist of a paddle-type fan with the bearings properly protected from dust. A main suction pipe is connected to the fan, and smaller branch pipes connect the machines to the main suction. Hoods are placed over the grinding wheels and are fixed to the ends of the branch suction pipes by means of telescopic tubes; this arrangement enables the operator to adjust the hoods close to the wheels when small articles are being dealt with, or to slide them up to admit larger articles. The pipes are usually made of sheet steel riveted and galvanized.

Accidents can in many cases be prevented by proper care. Some of the causes we have already mentioned, such as forcing wheels on to arbors which expand on account of heat and burst the wheel; other causes are allowing work to become jammed between the rest and the wheel; running wheels on unstable machines; either omitting to use flanges or using those of wrong or too light design; loose bearings; applying too much pressure to the emery dresser.

The following precautions should be observed by those responsible for the working of grinding wheels: The rests should be of substantial design, and should be used in such a position relatively to the wheel that it is impossible to get any work jammed between them. It is better policy to run each machine at one fixed speed, and this speed should be painted either on a board fixed near the machine or on the machine itself; as the wheel wears down it should be transferred to another machine making more revolutions per minute, so that the peripheral speed may be maintained. Where practicable this plan is preferable to the use of cone pulleys from the standpoint of safety, as it eliminates the danger of too high a speed being used by the uninitiated operator without the knowledge of the foreman in charge; although, on the other hand, considered from the practical working standpoint, it must be admitted that the cone pulley is certainly more convenient where only a few machines are used. Wheels should be kept true and in balance, and the dressing tools should be in charge of some responsible person. Machines should be enclosed as far as possible by sheet steel guards.

The Vertical or Horizontal Compressor?

By A. W. SWAN

IT is a curious fact that the trend of air compressor as distinct from low pressure blowing engine's design, has followed entirely different lines in North America and in Great Britain. With the exception of small air compressors for garage work, etc., and one special horizontal and vertical machine, American manufacturers have held to the horizontal design, while the trend in Great Britain is entirely in the opposite direction, and the horizontal compressor is unusual.

The reason behind this difference in design is largely a matter of tradition. England and Scotland have been for years the greatest shipbuilders in the world, and the marine engine has been developed largely by British engineers. The marine triple-expansion engine is invariably vertical. It was natural to keep to this construction for stationary steam engines for power houses, etc., and when the first air compressor cam to be built, steam driven, the line of least resistance was followed, and the air compressor was also built with the vertical construction, having the steam and air cylinders in tandem. On this continent the air compressor was developed independently from the steam engine, and while the advantage of the vertical construction were admitted, the horizontal compressor was seen to have its own advantages, and this style was held to. In a large part of Canada and the United States coal is both dear and difficult to procure, and the consequence has been the rapid development of Hydro-Electric power, and the decrease of direct use of steam power except in certain favored regions. One consequence of this has been the rapid development of the electric drive for air compressors, and a still greater separation from the old steam engine traditions. In Great Britain, on the other hand, while coal has risen greatly in price, it is always available—except during strikes—and while electric power supplied from central stations is making great strides, direct steam power is still used very largely. As a result of this, the steam-driven air compressor is still important and as a matter of fact, in the catalogues of some of the British compressor manufacturers the claims of the steam drive are urged quite strongly.

The principal advantage of the vertical type of construction is compactness; no horizontal compressor however arranged, can hope to compete with the vertical machine for minimum space. This feature is important chiefly where space is at a premium, as where a compressor has to be tucked away into a corner of an existing engine room. Another advantage urged for the vertical type of compressor, or at least, one that is put forward by the British manufacturers, is that with the horizontal construction the weight of the piston causes it and the rod to wear oval, with consequent loss of efficiency.

However, extreme compactness is not always the controlling factor in a compressor installation, particularly if the compactness carries with it some disadvantages, and if the vertical construction has such manifold advantages it is surprising that the Ingersoll-Rand, Chicago Pneumatic, Sullivan (except in their twin-angle machine) have held so tenaciously to the horizontal type of construction. The fact is, that horizontal construction of air compressors carries with it the great advantage of accessibility, which is often at least as important as extreme compactness. A well-built compressor will run steadily for months without even inspection, but even the best of machines is none the worse for an occasional run over, and if a compressor is built so that inspection is easy it is much more likely to have attention than one which is difficult of access. Even with the best systems of splash or forced lubrication, including strainers, etc., the oil should be cleaned out every now and again and sent to the filter; in fact, accessibility is a highly important and necessary feature in an air compressor. And the horizontal machine is certainly easy of access for inspection. The crank chamber can be inspected by lifting off a cover in some makes, cross-head and guides are similarly get-at-able. The cylinder is also easily accessible without having to climb a ladder to get at the cylinder head, and this applies particularly to the steam-driven compressor. Then as to the piston wearing oval, there seems to be another case where the theory sounds better than the actual facts; at least there are hundreds of large and heavy air compressors all over Canada and the United States, all of horizontal construction, and it certainly is not a common complaint to hear of pistons and rods wearing oval, and giving trouble in this way.

When all other considerations have been weighed, there remains one important advantage of the direct-connected horizontal air compressor—fewer bearings. The rotor of the motor for the direct-driven horizontal type of compressor is wound on the main driving shaft, and there are only two bearings. In the vertical machine the motor is at one end of the compressor, with the fly-wheel between compressor and motor. The motor has its own two bearings, there is another bearing between fly-wheel and compressor, and two more bearings in the compressor itself. The

whole unit is mounted on one base, and as the four bearings are bored at one setting, there will be no difficulty about securing correct alignment for the initial set-up. But maintaining correct alignment when the bearings begin to wear is another story. So that while the vertical direct-connected machine is satisfactory if properly erected, and if the foundation is absolutely stable, the direct-connected horizontal machine is easier to erect, and keep in alignment.

Summing up, it is seen that the vertical type of air compressor has certain advantages, such as compactness and evenness of wear of piston and piston-rod—these advantages being more apparent in the steam-driven machines, while the horizontal compressor scores for accessibility, and, in the direct-connected type, simplicity of erection.

EFFICIENT FOUR LEVER JIG

By HUGH SCOTT

It is not often that one jig can be made for four different levers, but the following one described accomplishes this fact very easily. The jig is by no means intricate in design, which is of course a point in its favor. Readers will do well to study this design as it is a sure money saver.

First let us refer to Figs. 1 to 4. Here we see the four levers, and, as can be noticed, the lengths from centre to centre are different, also the widths and diameters of the hubs. The holes and shapes are also entirely different for each one of these levers, so it was necessary that we design a jig that would incur no loss of time in changing over.

The operation to be performed of course was drilling. Every lever had to be drilled correctly without bothering to remove the jig from the drill press.

The large holes were drilled in the centres of these hubs, therefore this left only the question of designing a jig adjustable in such a way as to insure absolute correctness in the length from centre to centre, after the small holes were drilled. The result is shown at Fig. 5.

First look at the plan view. Note the line AB through which the section view shown below was taken.

The jig proper consists of the following members: A cast iron body rested on two legs as illustrated, and connected by two tie rods F. The top plate of the jig is finished and provided with the slot J. Another cast iron side G is fitted to this top plate in such a manner as to slide in the slot J already spoken of. This slide G can be fastened at any spot within the limits of the slot J by means of the stud and washer with the nut H. The upper shaft, or shank I, is turned to suit the hole of one of the levers.

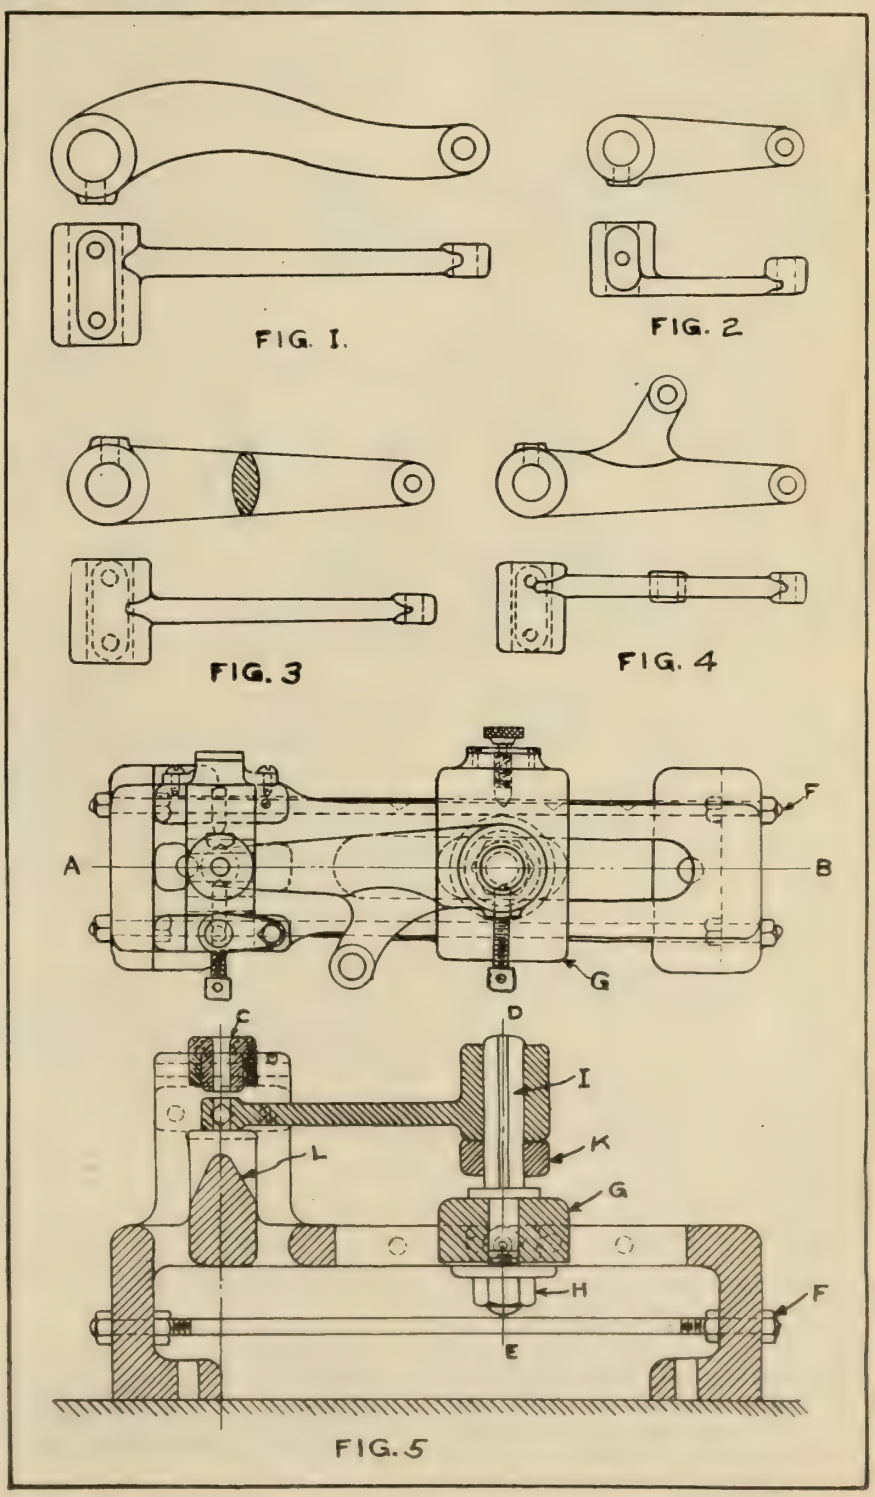
The collar K is adjusted by a screw to hold the hubs of the various levers at their correct height. This stud I already mentioned is provided with a groove which receives the hardened point of a screw which in turn prevents the collar from moving around. One side of the slide G is provided with a hub. This hub is drilled out to receive a pin. This pin is always pressed against the sides of the body by means of a spring. A knurled head serves to draw this pin back.

A projection is cast on the body and worked out to receive a steel hinge. This hinge is held by a small steel lever with a handle while the jig is in operation.

This jig is self-cleaning, since the chips all fall over a V-shaped rib L as shown.

This illustration shows one of the levers actually in the jig. If it is to be used for another size and shape of lever, the stud I is taken out and replaced by one which fits the lever to be drilled. The pin already spoken of is now drawn out and the slide G moved to its correct position and fastened to the nut H.

The jig is now ready for work, so we leave readers at this point to study it out for themselves.

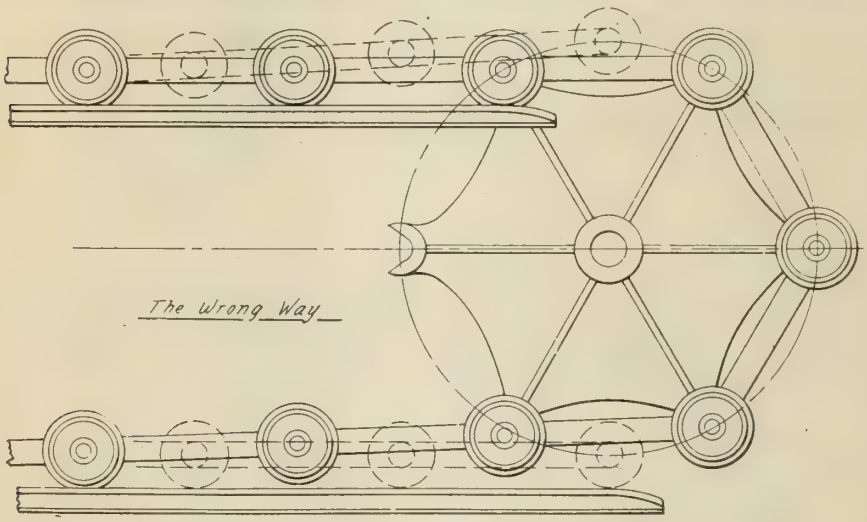


WHAT OUR READERS THINK AND DO

LOCATION OF RAILS IN BUCKET CONVEYORS

By John S. Watts

It is a peculiar fact, but all the bucket conveyors the writer has ever seen are built with the rails placed as shown in Fig. 1. That is, with the upper and lower rails in line with the tread of the wheel, when the wheel is at low point of the vertical movement, due to the revolution of the sprocket.



It must be admitted that to anyone without experience in operating these conveyors, the position of the rails shown in Fig. 1 would appear to be the correct one, but it is not, as will be shown in what follows:

In the sketch, Fig. 1, is indicated by dotted lines, the wheels in the position they will occupy when the sprocket has revolved 30° from where it is shown in full lines.

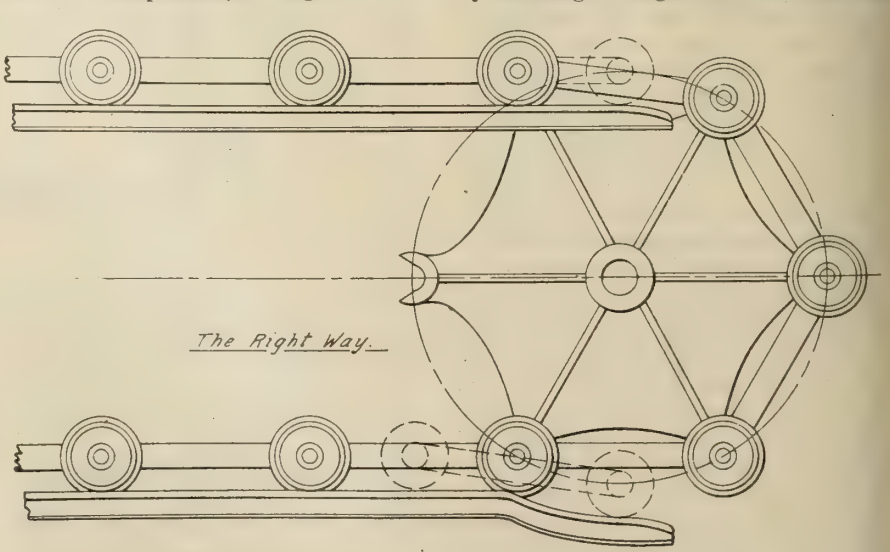
Taking the upper rail first, we find that the wheels and buckets have been raised from the rails, and of course will fall back on the rail when the sprocket revolves through another 30°.

On the bottom rail the same raising and falling of the wheels and buckets takes place, as is shown by the full and dotted lines.

With the large buckets now in use weighing as much as 3,500 pounds when loaded, the rising and falling causes a constant hammering of the wheels on the rails, accompanied by a deafening noise and destructive vibration in the whole structure. I have seen this effect so severe as to break the wheels.

The remedy for this hammering is to raise the rails up to the position shown in Fig. 2; this, as a perusal of drawing will show, prevents the wheels from ever rising from the rails and there cannot, therefore, be any hammering.

This change in the location of the rails can be made in conveyors already built by blocking up the rails to the required amount at the sprockets. The track may not be raised throughout the whole length of the conveyor as it will answer our purpose just as well if we start at that point at which the wheels commence to leave the rail. At this point the rail should commence to rise on a gradient such as to bring it up to the height shown at the sprocket, in Fig. 2.



PORTABLE LIGHTING FOR MACHINES

No matter how well-lighted a machine shop may be from a general effect point of view, the portable form of local illumination is always a necessity. The overhead fixed lamp, whether gas or electricity be the medium employed, may be quite adequate for setting up a job in a machine, or for subsequent plain, straightforward operations, but when it comes to precision work of a fine character, intricate operations, and a close attention to scribed lines, pop marks, or in measurement checking in thousandths, then the shadows created by interposing solid objects, and the lack of concentrated light, local rather than general, makes accuracy and working comfort a difficult proposition. It is a debatable point whether gas or electricity makes the best form of portable light; personally I am inclined to the former.

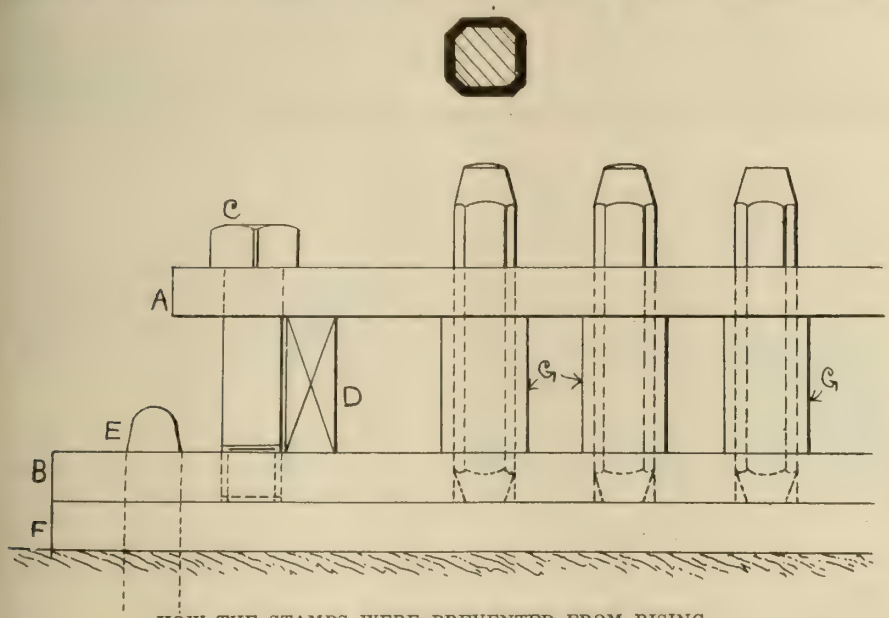
A convenient type for general machine operations is that which consists of just a short vertical length of, say, ¼ in. iron tube, furnished with an ordinary burner and a tap; the base being a fairly heavy block of lead, having a broad, flat bottom so that it shall not easily topple over. And it is always the better plan to use flexible metallic tubing rather than plain rubber. Often, too, it is desired to show a light some way down a deep hole that is being bored out or recessed, either in lathe or vertical boring mill. It will be found that an excellent portable lamp can be made by utilizing a length of ¼ in. iron tub-

ing welded up at the end and having drilled up the centre a 1-32 in. diameter hole.

PREVENTING STAMPS FROM RISING

By F. Horner

During the period of hostilities an urgent job of figure stamping came in, consisting of markings for depth in fathoms, on a ⅜-in. steel plate about a foot long. To locate the correct position of the stamps, a frame was built up as seen in the illustration (showing one end), comprising guide-plates, A and B, fastened together with a pair of set-screws, C, packing, D, being laid in as distance-pieces. The frame was located by dowell pegs, E, passing through the plate, F, to be marked, the pegs being driven into a baulk of timber acting as a cushion. The plate was therefore dropped over the pegs, the frame lowered over, and the stamps struck in rapid succession. The trouble was to keep these in position without bouncing up after the blow, and a simple solution of the difficulty was found in the shape of bits of rubber tubing, G, cut to length, and through which the stamps were forced.



HOW THE STAMPS WERE PREVENTED FROM RISING.

THE WELDER IN LOCOMOTIVE REPAIRS

The importance of having competent welders, particularly in the repair of locomotive boilers, was again emphasized at the recent convention of the Master Boiler Makers' Association. The boiler being, so to speak, the heart of the locomotive, any laxity in its construction or inspection is usually followed by disastrous results. One vital feature of boiler making and repairing is the practice now becoming quite extensive, of welding patches to the sheets when repairing cracked or otherwise defective parts of the boiler. There is no other form of repair work that may be so easily slighted through incompetent or careless workmanship and still pass the required inspection, only to fail at some critical moment in the operation of the locomotive. Many excellent papers are published from time to time in the technical journals devoted to railroad questions, and it is the duty of the men who have taken up welding to keep themselves fully informed concerning the methods and progress of the art of welding. Both the electric and the acetylene gas welding apparatus have been developed to a point where they require only careful and intelligent operation to secure satisfactory results. Anyone taking up this line of work may be assured of every assistance from the manufacturers of the welding outfits, as well as from their shop foremen, and should not fail to take advantage of every channel of information available. The importance of careful welding in every repair made to a locomotive boiler cannot be too strongly impressed on those who are engaged in this work.—"Railway Mechanical Engineer."

A machine piece is said to be tapered when no two places of its diameter are equal. Tapers are usually specified as the difference in their end diameters in inches, of a piece one foot in length, as, taper per foot.

$$\text{Taper per inch} = \frac{\text{Large Dia} - \text{Small Dia.}}{\text{Length}} \qquad \text{Taper per foot} = \frac{\text{Large Dia} - \text{Small Dia.}}{\text{Length}} \times 12.$$

$$\text{Large Dia} = \text{Small Dia} + (\text{Taper per inch} \times \text{length}) \qquad \text{Small Dia.} = \text{Large Dia.} - (\text{Taper per inch} \times \text{length})$$

$$\text{Length} = \frac{\text{Large Dia} - \text{Small Dia}}{\text{Taper per inch}}$$

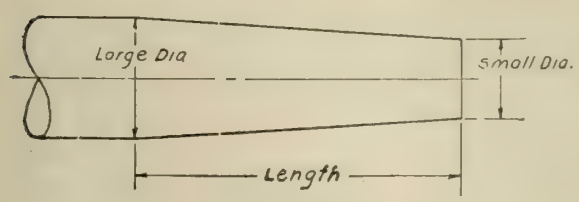
When the taper is excessive, its value is given in degrees.

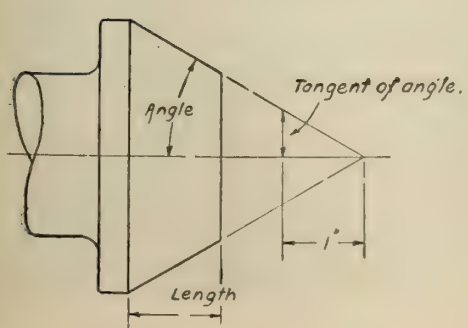
$$2 \times \text{Tangent of angle} = \text{Taper per inch.}$$

$$\text{Taper per foot} = \text{Tangent of angle} \times 24.$$

$$\text{Difference between both Dia's} = \text{Tangent of angle} \times \text{length} \times 2.$$

$$\text{Length} = \frac{\text{Large Dia.} - \text{Small Dia.}}{2 \times \text{Tangent of angle}}$$





L. Dia	S. Dia	Length	T.P.F	Tangent	Angle	Diff.
1.12		7.412	.4776			
2.46	650	6.250				
	3.210	2.240			20°	
	1.80			.8988		7.379
3.120		5.75	1.250			
3.40			6.270			2.650

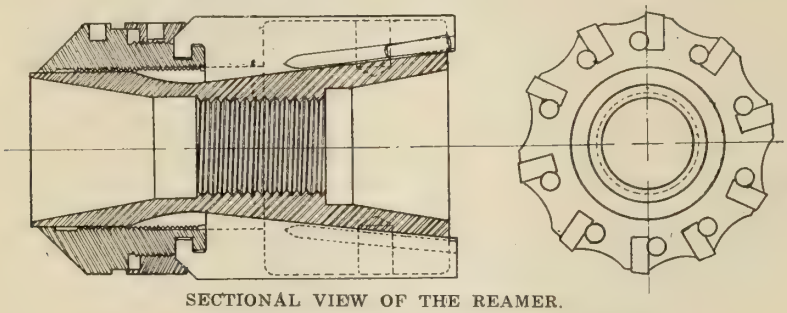
Tangent of angle = Taper per foot ÷ 24.

TAPERS.

DEVELOPMENTS IN SHOP EQUIPMENT

THE DAVIS EXPANSION REAMER

For a long time the old style of solid shell reamers were used, but with the constant improvement of other machine shop equipment, the necessity of a reamer whose blades could be expanded in a practical manner to compensate for wear, was keenly felt. Numerous types of adjustable reamers were placed on the market from time to time, the majority of which were controlled and locked with individual blade screws or pins. But none of these fully met all the requirements of the trade. The great percentage of these went into the discard, but there are still several types of adjustable reamers which have survived.



SECTIONAL VIEW OF THE REAMER.

Some time in the year 1909, Mr. E. E. Davis, general manager of the Davis Boring Tool Company of St. Louis, Missouri, also realized the necessity for a thoroughly practical expansion reamer. With the aid of his thorough knowledge of boring equipment and metal boring requirements, as well as an exceptional mechanical experience, he set to work solving the problem. The result was the Davis expansion reamer, one of the greatest improvements on record in the history of machine tools.

The entire principle and design of this tool were originated by Mr. Davis, and in December, 1912, a patent was taken out as a protection against infringement.

The distinguishing features of the Davis expansion reamer are simplicity and practical construction, with fewer parts than any other tool of similar type. All wearing parts are hardened. All threaded parts are protected from dust, chips or possible injury which might result from careless usage or accident.

The blades are positively controlled by an accurate micrometer adjusting dial, graduated in quarter thousandths, which acts for both expanding and receding of blades. The blades are slotted and fit over the ring on an adjustable dial which prevents their movement either way without turning the dial. When the reamer is set to size required the blades are individually and doubly locked to reamer body by a locking principle which positively locks the blades without the use of screws, virtually making a solid reamer in its entire principle.

Blade Efficiency

Davis expansion reamers require but three groups of blades to cover range of sizes from 1⅝ inches to 6 inches, inclusive. The large range of sizes covered, together with the greatest possible range of expansion, will show a decided increase in the number of holes reamed per set of blades.

When the blades for the 6-inch reamer are worn under size, they can be used in a number of smaller sizes down to and including 4-1/16 inches. Blades for the 4 inch reamer can be used in smaller sizes down to 2½ inches. Blades in the 2-7/16 inch reamer can be used in smaller sizes down to 1⅝ inches.

This is reamer blade efficiency at lowest blade expense, and means 100 per cent. to 300 per cent. more holes reamed per set of blades than with any other similar type of reamer.

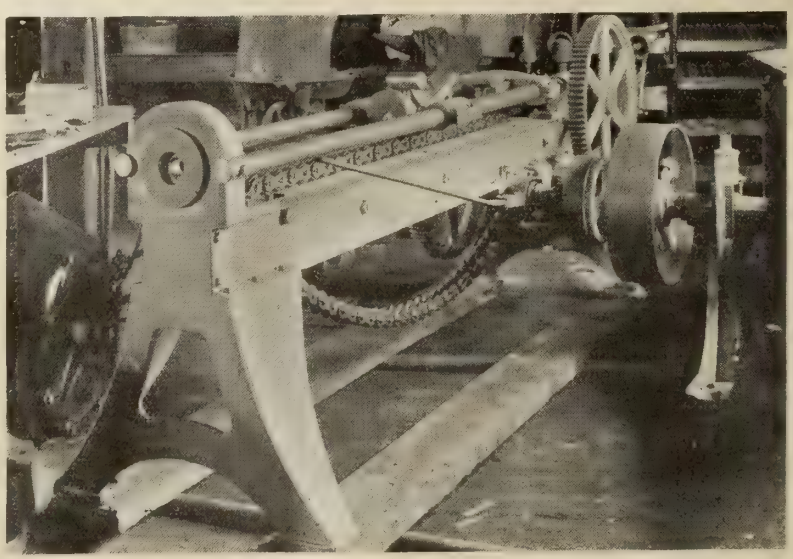
The Davis Boring Tool Company, Incorporated, are the originators of the forward movement of blades for the purpose of expansion in a tool of this type. This feature always keeps the blades cutting in advance of the tool body, consequently the blades never lose their bottoming feature.

DRAW BENCH

The Winterhoff Tool and Machine Co. of Elkhart, Ind., have placed on the market a new draw bench, as illustrated.

This machine is designed to draw tubes to a very thin wall, straight, and accurate gauge.

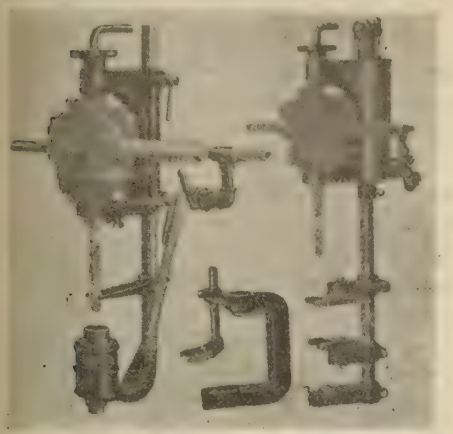
It is different from the usual type in that it is provided with guide rods that are in perfect alignment with pitch line of sprocket, and die hole in drawing head. It is also provided with safety stop that disengages hook from chain at any point desired. Chain is of standard roll link type and has a capacity of fifteen tons. Machine is back-geared to approximately 150 to 1.



GENERAL VIEW OF THE DRAW BENCH.

LABOR-SAVING SHOP TOOLS

The Liberty Tool Company, Baltimore, Md., is showing a number of new devices designed to effect time and labor saving in shop work.

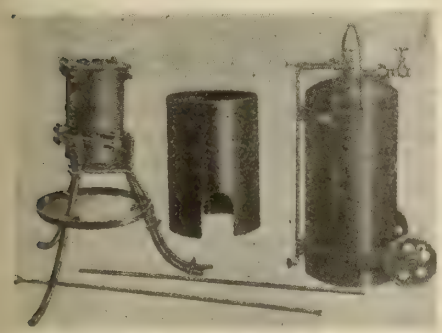


PORTABLE DRILL PRESS

Portable Drill Presses

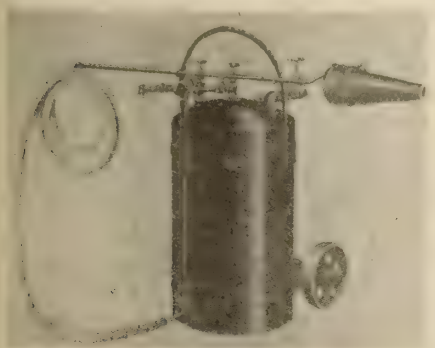
A portable drill press, designed to fit any make or shape of air drill having a vertical motor, is especially adapted for drilling and countersinking flange and plate work, such as firedoors, flue sheets and door sheets. This device has a 2¾-in. pneumatic feed end and is equipped with a sliding head taking any work from ½ in. to 14 in. thick. It will drill holes from ½ to 1 5-16 in. and countersink up to 2 in. in diameter.

A double cylinder portable drill press



RIVET HEATING FURNACE.

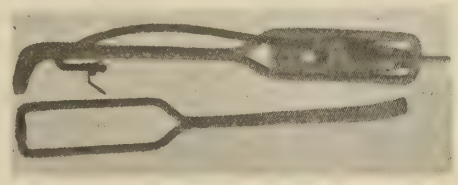
with a crowfoot attachment is designed for any class of work and fits any of the pneumatic drills commonly used. It is equipped with a sliding head and a sliding table, has an 8 in. pneumatic feed and will drill holes up to 1 5-16 in. and countersink to 2 in. in diameter. It can be used as a radial drillpress up to 18 in. in diameter of hole circle and the sliding head can be adjusted to take work up to 14 in. in thickness.



PORTABLE HEATING TORCH.

Rivet Heating Furnace

A portable rivet heating furnace using oil as fuel is designed so that the point of the rivet may be heated to any desired temperature, while the head is heated only to a cherry red or sufficient to readily conform to the work in the riveting operation. The top of this furnace is pierced with holes, through which the rivets are inserted, so that the point of the rivet is in the flame, while the rivet head rests on the outside or top of the furnace. The intensity and uniformity of heat may be regulated by means of a control valve.



HOLDING ON BAR

Portable Heating Torch

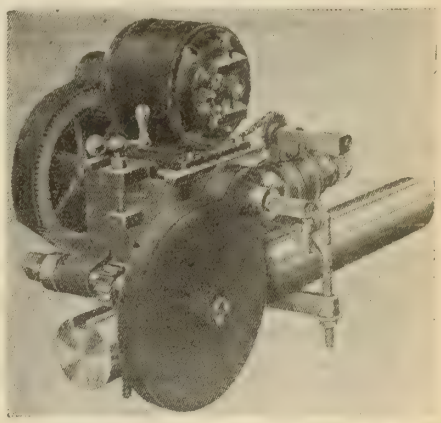
This apparatus consists of a fuel tank, a hose and a burner. The torch has one line of hose leading from the tank to the burner, which makes it convenient to handle in close places. This torch will heat to any desired temperature and may be used in the open air with excellent results.

Holding-On Bar

This holding-on or dolly bar has a pneumatic clamping device secured in a rectangular frame which is part of the bar itself. The bar can be placed in position quickly and the recessed end tightly clamped over the rivet. It may be readily applied in close quarters and is especially designed for use in locomotive flue sheet riveting and repair work. This company is showing a heading attachment for a riveting hammer, designed to rivet stay bolts and stay rods or countersink rivets and also a portable drill press for a close corner motor.

BUCHER-SMITH KEYSEATING MACHINE

The Bucher-Smith Co., East Liverpool, Ohio, is now manufacturing a portable motor-driven keyseating machine, in addition to its Style A hand-power machine. The machine shown is known as style A-2, and has a spur-gear drive. The sliding head is cast solid to the spindle; the feed screw, being inside the spindle, keeps the pulling strain close to the shaft. A power feed is furnished by a sprocket-chain connection from the main shaft to worm gearing on the screw. The depth of cut is regulated by the vertical screw shown above the cutter. The main shaft is squared on the end for a wrench, thus permitting hand-power operation if current is not available. The motor furnished is either alternating-current or direct-current and the power connection is usually the nearest lamp socket. The machine will cut keyways from ¼ to 1¼ in. wide by 12 in. long, and is suitable for shafts from 1¼ to 5 in. in diameter.



PORTABLE KEYSEATING MACHINE.

Ask the Men Who Have Gone Up

PREMIER DRURY has been speaking considerably on education, and in some respects at least he seems to be on the right track.

If he wants to get assistance in this matter he can do so by calling in some of the foremen and superintendents of shops who have come up through the ranks.

These men know what they were equipped with when they had to leave school. They know what was useful to them and they also know what they had in the way of surplus and useless knowledge.

They will all go back to the fact that they were not well enough equipped in the fundamentals of education. They wanted to know more about arithmetic and methods of doing it quickly. They wanted more reading and writing. They wanted these things and lots of them.

It would not be a hard matter to name a half-dozen men in the metal working lines who could give valuable advice along these lines. We mean men who did not have the advantage of a college education — men who started to learn a trade, and when at it a year or so found that they were up against a stone wall all because they did not know enough.

There is no doubt at all but that other lines of enterprise could furnish foremen and superintendents who have had the same experience.

Men who have gone through the mill, and who know what helped them through are in a better position than the finest book scholar in existence to advise those who want to make the public school curriculum suitable to provide that necessary "something" for the boys coming on now.

CANADIAN MACHINERY has no doubt that men who have worked and studied and burned the midnight oil to fit themselves for positions of responsibility and good salaries would be willing to sit down in conference with the provincial authorities and give them the benefit of dearly-bought experience.

Time To Quit Tinkering

HOW much longer can the state of industry on this continent continue to be tinkered with before it goes to smash?

A person hardly needs to be a pessimist to ask such a question. Certainly the most confirmed optimist can hardly close his eyes to the trend that events have been taking in recent months.

Just now we are coming to realize what the coal strike means. Not in Canada? Yes, but Canada is United States as far as the coal strike is concerned.

Go into the market to-day and try and buy steel and coal. Can you get them? You can not. Without any academic discussion on the merits or the demerits of the case, how are you going to get along without them? They are both basic purchases of the first water.

When officials of some of the miners' unions heard that the recommendation of the arbitrators awarded them fourteen per cent. increase, the expression alleged to have been used was "To hell with it!"

It is well that these words were used, because it brings into concrete form a spirit that has been rampant in an indefinable way for months.

"To hell with it!" is not nice language, neither is it good form to reprint it, but no other phase will state fully the frame of mind of many people on this continent who have the making or the breaking of our industrial prosperity in their hands.

The war has not taught the world very much. We made the sacrifice. It was enormous. It was ghastly and it was heart-breaking. We believed that the after-war period would see a kindling of the fires of love and tolerance and sacrifice in our national, industrial and individual lives. We had dared to think that somehow or other, from the furnace of suffering and death would come a conception of something higher and more worthy than money grabbing.

And to-day can you blame the man who looks around and asks where the improvement has come in? He sees strikes, discontent, probing into large profits, investigations into plots and uprisings against rulers and against governments. He does not see men in honor preferring one another, showing a spirit of kindliness and toleration.

Things are approaching the stage where the man who stands up now and tosses another monkey wrench into the wheel should be regarded as nothing less than the common enemy of all, and he should be dealt with accordingly.

THE International Association of Ash Sifters have officially opened the 1919-20 season. The slogan: "Dust thou art to dust returnest."

* * *

IMAGINE the good old days when a machine tool dealer could give you delivery in two weeks—and then was willing to stand back a spell and wait for his money.

* * *

MANY a salesman is successful on account of the things he does not say rather than for the things he does say.

* * *

SHORTER hours and less production will never remedy the condition this country faces. It is bound to mean lower wages and unreliable employment. The high mark for wages in Canada was in the munition shops, and those wages were possible on account of the high production secured.

Joins General Combustion Co.

NORMAN M. CAMPBELL

NORMAN M. CAMPBELL has resigned his position as general sales manager of Canadian Ingersoll-Rand Co., Limited, and as a director of that Company, having been appointed managing director of General Combustion Co., of Canada, Limited, with headquarters in New Birks Building, Montreal. He will assume his new duties on the first day of January next.

Mr. Campbell was born in Montreal in 1878, the son of Rev. Dr. Robert Campbell of that city. He was educated at Montreal High School, Abingdon School and McGill University, from which he graduated in 1899 with degree of Bachelor of Science.

On graduation he was appointed Assistant Engineer in the Waterworks Department of the Dominion Iron and Steel Co. at Sydney, during the construction of that Company's plant.

He joined the staff of the Canadian Ingersoll-Rand Co., Ltd., in 1900, as manager of their Toronto branch and was moved to Montreal to take a similar position there three years later.

In 1910, he was appointed general sales manager of the company, and during his tenure of that position he has had the satisfaction of seeing the Company grow from a very modest concern to its present status as one of the largest manufacturing plants in the iron and steel industry of Canada.

In the General Combustion Co. of Canada, Ltd., Mr. Campbell will have associated with him Dr. Milton L, Hersey and Mr. Henry H. Vaughan, both very well-known figures in engineering circles in Canada.

The Company was recently formed to exploit in Canada and Great Britain, industrial furnaces for annealing, forging, heat treating, etc., under the well-known Sklovsky patents, with the trade name of "OILGAS" furnaces, and from its inception it has been notably successful.

A Real Imagination

WE are indebted to "The Locomotive" for bringing this gem of pure imaginative effort to light. It is supposed that it was written by a member of the air service at Scott Field to his father and was found near the Southern Railroad Station.

"I have been appointed Mess Sergeant of the Flying Detachment, Scott Field, and to show of what my work consists, I will give some few examples of our tasks and efficiency.

"The kitchen range is 500 feet wide and 3,000 feet long, takes 27 experienced firemen to keep the heat at the necessary temperature, 400 cooks on duty at all times, 1,000 mechanical stokers for kitchen police and 1,000 assistant kitchen police who look after the stokers.

"Two hundred washing machines are used for washing the potatoes, 27 pile drivers mash them, 14 steam shovels shovel eggshells away from the kitchen door. Twenty-two Liberty motors are used in the coffee mills. Dirty dishes are hauled out to 11 blast furnaces, as the dishes are all paper and are burned after each meal. Hot cakes are mixed with 19 concrete mixers and 46 men with bacon rinds attached to their feet continually skate over the large griddle to keep it greased.

"Soup is made in an artificial lake, which keeps 34 dump trucks busy hauling the necessary ingredients. Cooks use steel boats and are dressed in asbestos clothing. Every few minutes they row to the centre of the soup lake and drop depth bombs to properly stir the mixture. Sixty-seven fire engines are used to pump soup to the 954 tables. Bread is cut by 11 high-powered band saws. A perforated endless conveyor properly salts and peppers the victuals. Twenty large street sprinklers are used to place syrup on cakes. Coffee is made in a 600-gallon tank and pumped to the tables through pipes by 17 centrifugal pumps. Ten five-ton rollers are used to roll the batter. To save labor and cost six-inch mains have been installed from 20 of the country's largest dairies for the supplying of milk.

"Radio telephones are used by the Mess Sergeant, who also uses a motor cycle in travelling around the dining hall and kitchen. All cooks wear gas masks. Ford trucks haul the silverware. Now, dear father, you can see just what I have to do and why I do not desire to quit the army."

The Old-fashioned Home

THERE is one place I like to go, of that there place I'll write—it's got your fancy dangled homes knocked higher'n a kite. To enter there's a tonic sure for every aching bone, that place is sure a wholesome one—a real old-fashioned home.

You seem to feel the home-like stuff before you're quite inside, there's not a touch of snobbery, of jealousy or pride.

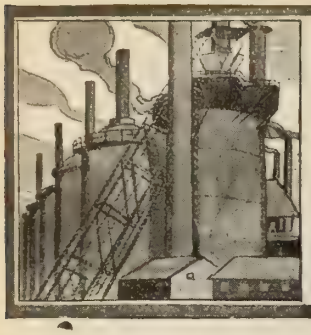
They haven't got those spindley chairs you fear to sit upon, nor the paper tinted to a shade betwixt the night and dawn. And cushions ain't piled up in hills, just to be squinted at; what's more, there is no Turkish rug nor Oriental mat.

But everything seems just to say, it talks as plain as mud, "Just come and rest your carcass here, you great big weary dub. It doesn't make no odds to me how hard or fast you sit, or whether you wear silk-lined gloves or just a home-made knit."

Perhaps the carpet's just as plain, 'twas rag made hit and miss, but it beams and shines and seems to say, this is a place of bliss. Folks like to joke about the words in mottoes on the wall, and 'bout the peacock feathers stuck resplendent in the hall. And if a spot appears upon the carpet by a chance, the folks don't throw a fit right off, or pass into a trance. It aint a very serious crime, it really aint, by heck—to spot a place upon the wall where flies have left a speck.

But sweet content is campin' there—it comes in like a flood, and you couldn't chase it out again with a broomstick nor a club. Let's toast the good old-fashioned home, with its dear old-fashioned airs, unspoiled by touch of higher art, nor cursed with three-legg'd chairs.—ARK.

IF PRICES and wages fall together, there is very little hardship on the individual, but on the other hand there is also very little benefit, and by far the best thing is for prices to fall and for labor costs also to fall by means of increased production. Increased production per man, with the help of improved appliances, may save the situation and enable us to retain and extend our industries at the time when severe foreign competition begins to operate and may even enable high wages to be paid, but without increased production the only conclusion possible appears to be that wages must fall or our industries will be killed. —*Machine Tool Review.*



MARKET DEVELOPMENTS

U. S. Rollers Do Not Want To Book Business

Canadian Buyers Find Trouble in Booking Tonnages at Large Mills—Looking for Higher Prices in 1920—Increases Are Noted in Wood and Metal-Working Machinery

SOME Canadian buyers have been in the steel district of the United States during the week in an effort to place business for future delivery. They found that rollers there were not anxious to discuss the proposition at all. In fact, it was intimated that some of the mills during the war had booked tremendous tonnages at current rates, and when the higher prices came they were not in shape to handle that business, being busy with the lower price contracts. They are not going to repeat that error, and to use the words of the buyer, they are not going to fill up on soup so high that they won't have room for turkey."

Indications point to higher prices for steel. The Corporation adheres to the schedule of March 21, but the Corporation can give no definite shipping promises. It seems likely that premiums will be frequent and of fairly large dimensions in the near future.

Increases are noted in machinery lines. One New York maker gives notice this week of a seven and a half Dealers complain that prices on high speed cutters are per cent. increase. Woodworking machinery goes faster than that, and increases in the last three weeks in some lines, when brought to a Canadian basis, would amount to almost thirty per cent., coupled with a delivery schedule that was inclined to be vague.

Old Country high speed goods are coming on the market again. The Canadian trade used to be good for these lines, but since the war it has been a great place for U.S. goods that got a start in here during the war rush. Stock lists and quotations show an ability to meet competition. being brought in some cases to a point where there is nothing in it for them. Apparently the makers consider that they can sell their output from the factory.

Shortage of supplies in the way of many lines that usually come from the U.S. steel mills, coupled with the shortage of coal, and the drastic methods that are being taken to meet the situation, do not help matters in the industrial world. They tend to create a hand-to-mouth policy, which precludes orders on a large enough scale to keep things moving in a good volume.

TOO LATE TO BRING SCOTIA COAL BY BOAT TO MONTREAL MARKET

Special to CANADIAN MACHINERY.

MONTREAL, Que., Dec. 11.—There is one ray of sunshine in the gloom of the present situation in the announcement that a satisfactory arrangement is expected this week in connection with the coal strike in the States; not that such action will offer any immediate relief to the existing conditions, but it will enable business to become more stabilized and permit of a more definite policy for trade developments and general industrial operations. Local plants have not been seriously affected by the inability to obtain coal, as many firms were well stocked with fuel when the strike came into force. The near approach to the close of navigation and the consequent increased difficulty of securing supplies were factors that were arousing considerable concern, but the prospects of a near settlement of coal troubles in the States has removed much of the tension of the past few weeks, but dealers and manufacturers realize that all is not smooth running yet, and that every precaution will have to be taken to conserve available supplies, as it will be many weeks, or even months, before the lost production can be made up and shipments normal. There has been some talk of bringing supplies from the Maritimes, but with the St. Lawrence closed, this would entail long haulage over the railroads—almost a prohibitive practice. Recent export trading has been somewhat adversely affected by the low British exchange rate, a factor that prevents expansion of Canadian export trade.

Steel Supplies Falling Off

Apart from the possibility that the coal strike in the States may be terminated this week, there is little new in the present industrial situation. Conditions here have not been acute, but the disturbances in the American coal fields, and the uncertainty of fuel shipments to Canada, have gradually increased the tension in regard to the continuance of industrial operations. Curtailment of productive activities, which have become so general in the States, has not been found necessary here, as yet, although the attitude of the U. S. authorities in withholding coal shipments has caused some unfavorable comment in Canadian business circles. The present demand for steel and the inability to supply the same would be ample excuse for a higher price on finished materials, but large producers are apparently not departing from the policy of keeping the quotations from soaring to runaway figures, which would be the case if a lead was once given. Whatever is being done in the way of premiums there is little appearing on the surface to indicate that transactions are carried on on other than the quoted basis. Dealers here report difficulties in getting materials shipped in from the States, and long delays are frequently recorded, even after the stuff has left the mills or the warehouses. Local stocks are not all that could be desired and in such lines as sheets, plates and tubes, it is only in the less-called-for sizes that stocks are reported, and even here the supply is gradually falling. The

general market is strong and quotations given should only be considered as nominal.

Dealers Await Developments

Nothing of importance has developed in the old material situation and the dealers are still waiting for something to turn up that will revive the demand. The disturbed state of industry across the line has not been conducive to the buying of scrap and local trading is not in sufficient volume to cause other than normal comment. Shipment of scrap out of the country has fallen off considerably, and in consequence the present market has a weak tendency. Dealers are looking forward to better buying in a week or so, as reports point to an early resumption of coal mining operations. It will be some time, however, before normal steel operations can be resumed, as it will require some little time to restock depleted coal piles. Dealers are holding to quoted prices, but state that they are of a nominal character, and governed by individual transactions.

TENDENCY NOW IS MUCH HIGHER

And U. S. Mills Are Not Anxious to Take on Much Business for 1920 Delivery

TORONTO.—Prices have crowded into the centre of the stage as far as the machine tool and iron and steel market is concerned. There may be some price lists that still exist as absolute, but they are becoming more infrequent, and the tendency seems to be to withdraw all quotations, and give prices on request for actual delivery. This is not a very satisfactory way of doing business for either the consumers or the dealers, but it is about the best that can be done now.

The Machine Tool Market

The market for wood working machinery is just as uncertain as in the metal working lines. There are cases where makers of machinery have made advances as high as twenty per cent., which, in this country, would be worth thirty per cent. on account of duty and exchange. Metal working machines are more firm in regard to advances, and few have been made during recent weeks. It amounts to practically the same thing, however, as many builders refuse to quote any price at all for future deliveries. As far as can be seen they are willing to accept business for future shipment, but only on the understanding that price shall be that which is prevailing at the time of delivery.

This is being reflected in the used machinery trade. One dealer informed CANADIAN MACHINERY this week that instructions had been sent out to hold up all prices quoted on used equipment, as there would likely be a revision in the near future.

Cutting Prices Now?

Some of the salesmen handling certain lines of high-speed goods complain that prices are being cut below where they can make any money in the business. It is hard to explain why, but it is a fact that U.S. concerns are now paying net list for high-speed cutters, while in Canada the price is ten off. This has been the prevailing price for some time, but just recently quite a lot of buying has been done at ten and ten off. The jobber complains that he can do nothing at this price. Of course, it is all right for the concerns using the cutters, as they are getting a close price, and they know it. English firms are getting in shipments of high-speed once more. Prior to the war the high-speed steel market in this country was largely in the hands of the British makers, but during the time of the war, owing to the need for material at home, and the inability to get shipments through, the business passed largely into the hands of American firms. It is evident that British makers are out now to get a slice of that market back again, as they are putting in their high-speed goods in some cases at a price which is ten per cent. better than the local quotations.

The Market For Steel

As far as the jobbers are concerned, price lists appear to have ceased to exist. They may still be in existence for the guidance of buyers, but for actual transactions in sheets, plate, tube, etc., they have passed out for the time being. Figures that are quoted elsewhere in CANADIAN MACHINERY in these lines are simply nominal. When a house has nothing to offer in the way of sheets or plate it might as well quote ten dollars as one dollar.

Bar mills in this country have gone up $7 per ton in the last three weeks. United States mills, according to Canadians who have been over the ground recently, are not in good shape, or at least they are not taking on business. It looks very much as though some of the mills were looking for better prices in the spring, and are not inclined to book up at present quotations. It may be that they even expect prices to mount rapidly when the spring rush comes, as it surely must come.

Here is the way one Canadian buyer sized the situation up for CANADIAN MACHINERY: "It looks to me as though the mills in United States had profited by the lessons they learned during the war. At that time they booked away ahead, and piled up enormous tonnages. The result was that they were kept busy grinding away on this stuff at a set price, while other mills with not such great bookings were at liberty to go out and take on business that was pressing for delivery and therefore willing to pay a higher price. As one of the U. S. men stated the case a few days ago: 'We do not propose to be caught as we were during the war. Then we were so filled up on soup there was no room for turkey when they passed it to the mills. This time we are going easy on the soup and we are going to sit up when the turkey comes.' Which is another way of saying that they intend to roll easily for the present and when the higher prices become common they will roll seriously."

The independents are acting pretty much together at present taking their lead from the Corporation. The Corporation is becoming pretty well booked ahead and will not promise anything in the way of deliveries, although adhering to the prices of March 21. It is figured out now that the independents realize that urgent buyers will be in the market and prices are liable to soar in proportion to the urgency of each separate case.

POINTS IN WEEK'S MARKETING NOTES

One maker of lathes has notified the New York market that he is making a seven and one-half per cent. increase in his selling prices, effective at once.

—

Advances are recorded in several lines of wood-working machinery, some of them, by the time they reach this country, amounting to as much as 25 and 30 per cent.

—

English high-speed goods are coming on the market here once more. For some time American goods have held this market on account of the inability of British makers to ship here.

—

Dealers claim that prices are being shaved again on high-speed cutters. U. S. buyers get these at net list, while Canadian prices are ten off, and some fairly large orders have been taken at ten and ten off.

—

Canadian buyers going into the United States to place plate and sheet business find the mills there not anxious to talk future orders at all. Apparently higher prices are in store in the spring, and many of the mills want to be in shape to roll at the new quotations.

—

Scrap metals are dull this week. Coppers are apparently now at their low mark, and improvement is anticipated. Iron and steel are holding at the advances that were marked up for them last week. No. 1 machinery scrap is very much in demand.

—

Tin plate rollers are closing down first in United States, as steel for that purpose has to be heated six times. Curtailment on other lines is necessary on account of coal and coke shortage.

—

Iron and steel jobbers have for the most part taken their quotations in for the present, prices being given on application for certain definite lots.

The mills at the Soo of the Algoma Steel Corporation are busy now, having a lot of business on their books, especially in the merchant bar mill. The demand is very strong for small bars, reinforcing bars structurals the Soo mill now rolling up to 15 in. in the latter.

The Non-Ferrous Markets

Coppers are showing a little more strength, but the market is crowded with material, owing to the manner in which United States exchange is working against business being done in that country. It might also be mentioned that speculators who had bought some time ago in the hope of a rise in the copper market are having a merry time trying to hang on in hopes of a better chance for them turning up in the near future.

Scrap Not Active

Coppers in the scrap market are weak, with little demand either way from dealers to users or from pickers to dealers. The steel and iron section is stronger and holding well at the advanced prices that were marked up last week.

Mr. J. H. Laroche, of Ste. Croix, Quebec, has written to CANADIAN MACHINERY asking where he can secure No. 1 machinery scrap, and what he will have to pay for a car load.

MACHINE TOOL TRADE NOT HURT MUCH BY THE COAL STRIKE YET

Special to CANADIAN MACHINERY.

NEW YORK, December 11.—It is a matter of some surprise to the machine-tool trade that business has held up so well in spite of the somewhat uncertain industrial outlook brought about by the coal situation. The explanation may be that far-seeing manufacturers do not anticipate any long-drawn-out coal strike and are preparing to take advantage of the backed-up demands for all products that may exist when the coal shortage has been overcome. Deliveries on nearly all standard tools are now from two to four months or longer overdue, and if coal shortage affects output of machines, as it is very likely to do, these deliveries will be extended even further, without any increase in business. Therefore, those who have faith that the industrial situation will right itself within several weeks, at the most, are not loath to place their orders to insure reasonable delivery.

The General Electric Co. is one of the most active buyers, so far as quantity is concerned, but there is general buying of small lots of tools which extends to manufacturing plants in nearly all metal working lines. The General Electric Co. will buy equipment for its two new plants at Rochester, N.Y., and Decatur, Ind. The latter plant will make small motors. It is reported that the company has received a contract for one million vacuum cleaner motors. The New Departure Mfg. Co., Bristol, Conn., has not quite completed its buying as more tools will be purchased soon for its coaster brake department. One large machine-tool concern received an order from this company for $600,000 worth of tools. The Willys Corporation, Elizabeth, N.J., is buying tools almost every day for the additions at its plant. It will be about June 1920, before the company gets on a real production basis on its new six-cylinder light automobile. Equipment will also be bought soon for another unit of the Willys Corporation, the plant of the Electric Auto-Lite Co., Poughkeepsie. The Dupont Motors Corporation, which is building a new automobile plant at Wilmington, Del., will be in the market for equipment soon, so also will two other Eastern automobile companies, the Rolls-Royce Co., Springfield, Mass., and the Stevens-Duryea Co., Chicopee, Mass.

The Nathan Mfg. Co., New York; the Mergenthaler Linotype Co., New York; the Newport News Shipbuilding & Dry Dock Co, Newport News, Va.; the Traylor Engineering & Mfg. Co., Allentown, Pa.; the International Motor Co., Allentown, Pa., and the De Laval Cream Separator Co., Poughkeepsie, N.Y., are among the companies which have come into the market for small lots of tools.

An officer of the Greek navy is in this country to confer with machine-tool builders relative to a list of equipment for a naval air station to be built in Greece. The equipment has been figured on in England, but a part of it may be bought in the United States owing to the high prices prevailing in England.

A leading manufacturer of turret lathes has advanced prices 7½ per cent.

SHUTTING OFF SOME MILLS NOW BECAUSE COAL AND COKE ARE SHORT

Special to CANADIAN MACHINERY.

PITTSBURGH, Dec. 11.—Last week, when the coal strike had already lasted four weeks, occurred the first noticeable curtailment in steel mill operations, while predictions were that if the coal strike continued a fortnight longer a large part of the industry, perhaps half, would have to close. Nevertheless coal production has been increasing, by the non-union mines doing better, and by a union mine here and there resuming production. The explanation of the currents thus crossing is of course that the steel mills had been operating chiefly on their stocks of coal, and these stocks were nearing exhaustion.

Inasmuch as the steel is heated six times in the process of making tin plate, it is not surprisng that the first cases of mill closing reported were tin mills, including the American Works, Elwood, Ind., and the Gary tin plate department, both of the American Sheet & Tin Plate Company, and of some at least of the tin mills of the Trumbull Steel Company, Warren, O.

With only a gradual increase in coal production this closing of mills will spread, there being many requirements more essential. Only a practically complete resumption of the union mines can put the steel industry in an easy position, but if there is such resumptions the industry will be relieved almost at once, since there are stocks of coal held by the railroads for distribution to the most important uses, and these would be released as soon as it became known that fresh supplies were coming. Closings, if they occur, will probably affect the rolling and finishing of steel somewhat more than the making of steel. Even now some mills are husbanding their coal by putting steel through the finishing processes that require the smallest quantity of coal per ton of product.

By the order determined upon by the Fuel Administration, Dec. 2, the production of beehive coke is being restricted about 25 per cent., the regulation being effected through the medium of car supply for coke loading. In Connellsville region the regular procedure is likely to be for the railroads to furnish no coke cars Wednesdays and Thursdays, coal cars being furnished on those days. There has been a rush on the part of blast furnaces to pick up any lots of furnace coke available, and in the space of one week the market price of Connellsville furnace coke for spot shipment advanced from $6.25 to $10, on transactions involving very limited tonnages. Some conservative coke operators deplored the advance, but had no coke to offer at the prices they considered reasonable. Some of the buyers were furnace interests whose supplies from other coke fields, or from their by-product operations, had been decreased, while others were regular customers of the Connellsville region who desired to gather up a surplus against contingencies.

The Iron and Steel Strike

All interest in the iron and steel strike is now lost, the coal situation being of vastly more consequence than what little remains of the iron and steel industry's own strike. The Wheeling district remains largely closed with rumors, denied at strike headquarters, that the strike in general has been called off. At various other points there remain some strikers, but the mills where they remain strikers are more interested in lining up the men in employment and organizing them into efficient working units again, than in getting more men into employment. Even in the Mahoning valley, which next to the Wheeling district has held out the longest, some mills are turning away an occasional applicant for a job, as they either do not need the man at all or are not ready for him.

Pig Iron Movement May Be Over

There are distinct suggestions that possibly the pig iron buying movement is about over, in which case the remarkable rise in prices will stop. Inquiry is certainly much less widespread, but whether that is because consumers are now well covered in most cases, or because the consumers remaining uncovered feel that the advance has gone too far to make it worth while for them to cover now, is uncertain. It is learned that there was a considerable volume of speculative buying, particularly of Buffalo and Eastern Pennsylvania iron, in the advance, and the speculative holdings may disturb the market at some later time.

An effect of the advance in pig iron has been to encourage the Connellsville coke operators to demand more money for coke for 1920 delivery and most of the furnaces that have closed for coke have had to pay large advances. Another effect may be to encourage an advance in Lake Superior iron ores for the 1920 season, whereas a month ago it seemed certain that the ore interests would be quite content to go along for another season at the established prices. The furnaces will be consuming 1920 ore into May or June of 1921 and if the pig iron advance they have brought about does not hold they may find themselves not much ahead in the final reckoning.

Foundry and basic grades are no higher than a week ago, being at $33, valley, equal to $34.40, delivered Pittsburgh, but Bessemer has scored an advance of $1 a ton, to $35, valley, two sales having been made at this price, one of 500 tons for December and one of 3,000 tons for equal deliveries over the first half of 1920.

Steel Prices

The finished steel market has not gained perceptibly in strength in the past week, except perhaps in the case of small lots from stock. The chances of the mills that are out for the highest prices obtainable are not as favorable and the policy of these producers, including the Steel Corporation, of adhering strictly to the March 21 price schedule stands better chances of dictating the general market level. For a time it was maintained in some quarters that the mills adhering to the old prices would become so hopelessly over-sold that the market would be thrown into the hands of the mills that intended to get the highest prices obtainable. This the March 21 price mills are endeavoring to avoid by limiting their sales to regular customers and in many cases, furthermore, by cutting down the tonnages inquired for. Undoubtedly there will be demand for many months to come for all the steel that can be made, the only issue being as to prices exacted. Export offerings are extremely limited and are likely to continue so, more or less, but as there will probably be little disposition to limit prices in the case of export business there may be considerable incentive to sell for export. The uncertainties of the foreign exchange situation help to discourage mills from forming any definite export policy.

The Week's Events in Montreal Industry

Preparations are being made by the management of the Canadian National Railways to haul from the Eastern seaboard all the available supplies of coal as a reserve, should the tie-up across the line continue. It is expected that when the details have been completed, not a single empty car will be brought back from the Maritime Provinces to either Ontario or Quebec, but that these empties, which are constantly moving from the seaboard to the interior, will be utilized to haul in a big reserve supply for the interior provinces. This will then be available should it be needed for emergency.

After a period of unrest of several weeks a strike of the miners of the Minto Coal Company at Minto, N.B., has become effective and the mines are now practically idle. It is estimated that about two hundred men are involved, and the normal production of coal that will be affected wil be approximately 350 tons per day.

Capt. E. J. Edwards has been appointed Trade Commissioner for Montreal, succeeding G. T. Milne, who will join the British Legation in Cuba as commercial secretary. Mr. Edwards is now in England but will leave there shortly to assume the duties of his new office. He has been associated with the British Naval Service and latterly as sales manager of a large manufacturing firm.

Considerable interest has been aroused over the proposal to erect a sixteen-storey hotel on one of the main streets of Montreal. One of the obstacles to the scheme is that of the existing by-law restricting the height of buildings to ten storeys. It is possible that this objection will be overcome by issuing a special permit, provided no great expense is incurred by the city in the matter of suitable water supply and fire protection.

The Elder-Dempster cargo steamer "Bassa," which grounded in the mud of the harbor on November 28 when clearing for South Africa, has been successfully floated after a week's effort to free her from the fixed position. It was necessary, however, to remove a large portion of her cargo before sufficient buoyancy could be obtained for the final release. She is now in drydock at Vickers undergoing light repairs.

The settlement of the strike of freight handlers at St. John, N.B., has been negotiated and the men are all back at work and the port is again resuming normal activities. For some time ocean traffic has been diverted to other terminals and St. John has suffered considerably but shipping men are more encouraged as to the future prospects. It is estimated that nearly half a million dollars was lost to the port as a direct result of recent disturbances and loss of business.

The Marconi Wireless Telegraph Company of Canada has purchased the four-storey stone structure at 11 St. Sacrament St., Montreal, and will utilize the greater portion of it for the main offices of the company. This building was originally erected for the Montreal Stock Exchange. The offices will be entirely remodelled and the building known as the Marconi Building. The company will still retain the factory on William Street. It is also proposed to open a school for the training of wireless operators.

S. P. Brown, the engineer who was in charge of the construction work on the Mount Royal tunnel, was drowned last week in Sebec Lake in Maine. He was dragging his nine-year-old son on a sled at the time when the ice gave way beneath him. Before assistance could be obtained he sank. Mr. Brown was an American citizen but superintended the planning and the subsequent building of the tunnel, one of the most important works of its kind ever undertaken, it being a record achievement both as to the time in putting through the hole and the successful working out of the details of construction.

At a recent meeting of the Montreal branch of the Engineering Institute of Canada, the subject of returning the railroads back to private ownership was presented to the members by W. F. Tye, the well-known railroad authority. The speaker went very thoroughly into the subject and commented on the general success attained by roads under private control. It is the opinion of Mr. Tye that the only solution to the transportation problem was for the Government to give decided increases in freight rates, and after putting the roads in first-class shape, organize new companies to take over the roads and operate same as private concerns.

T. B. Macaulay, president of the Sun Life Assurance Company of Canada, who has recently returned from a visit to the West Indies, addressed a recent meeting of the Montreal Board of Trade on the subject of "Relations With the West Indies." Mr. Macaulay is quite enthusiastic over the trade possibilities with these colonies, and believes the time is opportune for Canada to share extensively in the development of the West Indies, not in the sense of union with this country, but in close co-operation with local authorities and business houses, believing that close co-ordination between the colonies is essential to Empire progress.

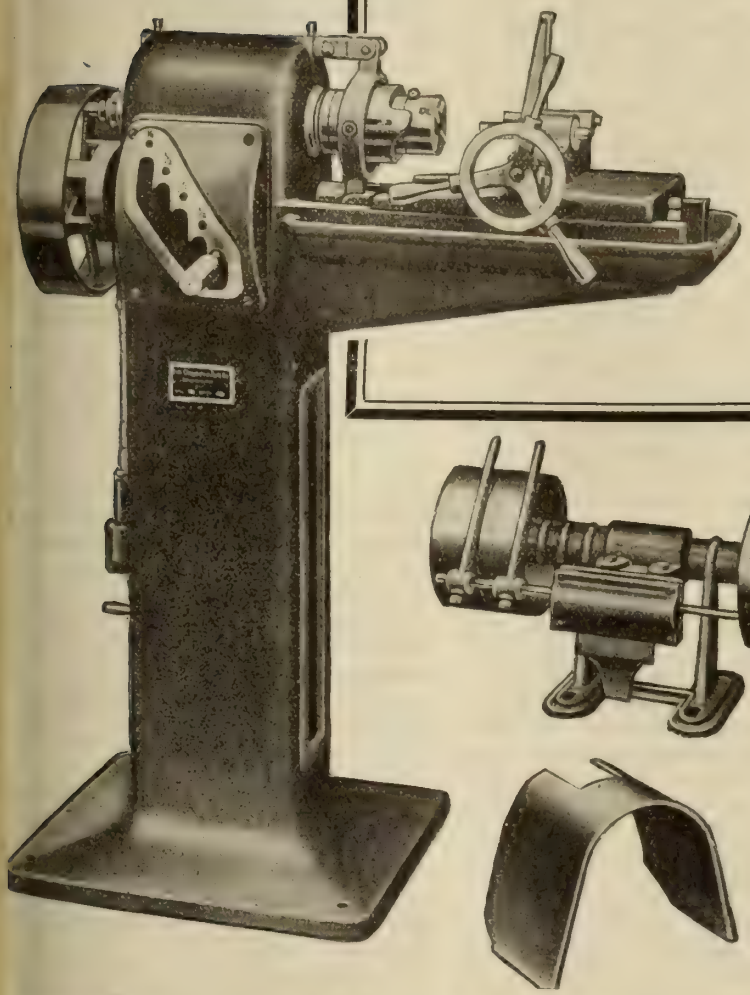
THE GEOMETRIC WAY

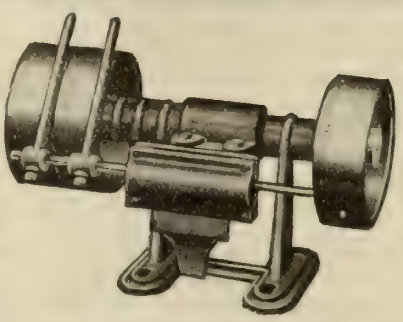
Where quantity and exactness have to be considered, the Geometric Threading Machine is just the way that suits. These machines have been tested and proved over and over again on speed, accuracy and endurance.

Geometric Threading Machines are employed on a large class of small threaded parts that cannot be produced economically on the ordinary screw machine.

Made in three sizes—to cut 1/8 to 1/2 inch, 1/4 to 3/4 inch, and 3/4 to 1 1/2 inch diameter threads. The carriage is mounted on slides and on the largest size machine is moved back and forth by rack and pinion, and in the smaller sizes by hand.

Spindle speed changes readily made, adapting the machine to the diameter and material of the work. An adjustable stop assures accurate length of thread, and automatically opens the die head, permitting of drawing the work straight back.





A line from you brings full details regarding this machine. Tell us your threading requirements — let us recommend the proper Geometric Collapsing Tap or Self-opening die.

Henry Ford's View on a Very Vital Question

In the issue of the Dearborn INDEPENDENT, *on "Mr. Ford's Page," which appears this week, is the following article. It discusses the amount of profit in a day's wage. How much does it cost a man to produce a day's work?*

How much profit does a workman reap from his day's labor? How much ought he to reap? Does a "good living" come under the head of profit, or is it properly a part of the cost ofproducing a day's labor? How far can human energies be measured and human values standardized in order that the cost of a day's labor may be standardized?

Questions like these occur in one period or another of every man's thought about a system of economics which shall be more solidly based than any which serves us now.

But a more than academic interest attaches to these questions, for they are the real, even if unspoken, basis for much of the irritation and confusion which exists in the industrial world today.

The workingman is beginning to understand that he is in business. His raw material is human energy. His product is a day's work. All other business men seek a profit above cost of production, why should not he?

The difficulty thus far has been in making out the cost sheet. How much does it cost to produce a day's work? —that is the question for which there seems to be no satisfactory basic answer.

It is perhaps possible accurately to determine—albeit with considerable interference with the day's work itself—how much energy the day's work takes out of a man. But it is not at all possible to accurately determine how much it will require to put back that energy into him against the next day's demands. Nor is it possible to determine how much of that expended energy you will never be able to put back at all—because a "sinking fund" for the replacement of the body and vital strength of a worker has never been invented.

It is possible, however, to consider these later problems in a lump and provide for them under a form of old-age pensions; but even so, we have not thus attended to the question of profit which each day's labor ought to yield in order to take care of all of life's overhead, all physical losses, and the inevitable deterioration which falls upon all earthly things.

Moreover, there are questions having to do with the pre-productive period, which would have to be solved. Here is the man, let us say, ready to begin his service to society by turning out days' work throughout his life. How much did it cost to rear and educate him to his present age and usefulness? And how can that be figured as part of the cost of the energy he puts forth as he works to-day? Now, if it were the case of a machine, you would know what to charge. The machine cost a certain sum; it wears out at a given rate; it would cost such-and-such an amount to replace. It is a simple matter to figure the actual cost of the machine and its productive work, and add the profit.

Can we do that with men? Rather, can men do that for themselves, so that

> THIS article discusses the amount of profit in a day's wage. How much does it cost a man, in strength, money and ability, to produce a day's labor? How much profit ought he to receive on that outlay? How can basic figures be obtained on these matters?

selling a day's work they will have as intelligent an idea of the cost of that day's work and the profit it ought to bring, as any manufacturer ought to have of his product?

The problem becomes more complicated when you consider the man in all his aspects. For he is more than a workman who spends a certain number of hours at his work in the shop every day.

If he were only himself, the cost of his maintenance and the profit he ought to have would be a simple matter. But he is more than himself. He is a citizen, contributing by his cultivation and interest to the welfare of the city. He is probably a householder, living under conditions which represent more than mere maintenance, in that they represent the graces of social life. More than that, he is probably a father with more or less numerous progeny, all of whom must subsist and be reared to usefulness on what he is able to earn.

Now, it is obvious that to regard the man alone, refusing to reckon with the home and the family in the background, is to arrive at a series of facts which are misleading and which alone can never suffice even for a temporary solution of the questions that concern us.

How are you going to figure the contribution of the home to the day's work of the man? You are paying the man for his work, but how much does that work owe to his home? How much to his position as a citizen? How much to his position as the provider of a family? The man does the work in the shop, but his wife does the work of the home, and the shop must pay them both: on what system of figuring is the home going to find its place on the cost sheets of the day's work? It finds its place there already in a sort of haphazard way. If a man cannot support himself, his wife, his children, his habitation, his position in society—why, he doesn't stay at the job, that's all. It isn't a matter of cost and profit to him; it is the matter of a "living."

Is a man's own livelihood the "cost"? And is his ability to have a home and a family the "profit"?

Is the profit on a day's work to be computed on a cash basis only measured by the amount a man has left over after his own and family's wants are all supplied?

Is the livelihood of five or six persons beside those of the actual worker to be charged up to "profit"?

Or, are all these relationships to be considered strictly under head of "cost," and the profit to be computed entirely outside of them? That is, after having supported himself and family, clothed them, housed them, educated them, given them the privileges incident to their standard of living, ought there to be provision made for still something more in the way of savings profit, and all properly chargeable to the day's work? These are questions which call for accurate observation and computation.

Perhaps there is no one item connected with our economic life that would surprise us more than a knowledge of just what excess burdens the day's work actually carries.

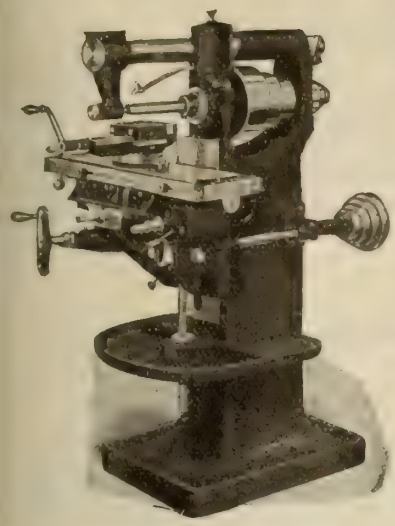
It carries all the worker's obligations outside the shop; it carries all that is necessary in the way of service and management inside the shop. The day's productive work is the most valuable mine of wealth that has ever been opened.

Certainly it cannot be made to carry less than all the worker's outside obligation. And certainly it ought to be made to take care of the worker's sunset days when labor is no longer possible to him, and should be no longer necessary. And if it is made to do these, industry will have to be adjusted to a schedule of production, distribution and reward which will stop the leaks toward the pockets of men who do not assist production in any way, and turn all streams for the benefit of those who do. In order to create a system which shall be as independent of the good-will of benevolent employers as of the ill-will of selfish ones, we shall have to find a basis in the actual facts of life itself.

It costs just as much physical strength to turn out a day's work whe

MACHINE TOOLS

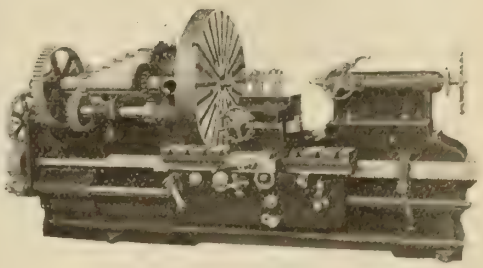
New or Used



We have an excellent list of new and used machine tools in our Toronto warehouses and on order for early shipment.

YOU are undoubtedly from time to time buying new equipment.

YOU will profit by giving us an opportunity of quoting you.



Garlock-Walker Machinery Company, Limited

32 Front St. West, Toronto

MONTREAL - - WINNIPEG

"Everything in Woodworking and Metalworking Machinery"

wheat is $1 a bushel, as when wheat is $50 a bushel. Eggs may be 12 cents a dozen or 90 cents a dozen—it makes no difference in the units of energy a man uses in a productive day's work.

One would think that the real basis of value would be the cost of transmuting human energy into articles of trade and commerce. But no; that most honest of all human activities is made subject to the speculative shrewdness of men who can produce false shortages of food and other commodities, and thus excite anxiety of demand in society.

It is not in industry that the trouble lies, but in those regions beyond, where men lie in wait to seize the fruits of industry and create false scarcities for the sake of arousing an anxious demand for things which normally are, and ought to be, accessible to all who engage in orderly productive pursuits.

We must begin with the land; we must continue with the day's labor; and we must keep so close, so jealously close to both these fundamentals that we shall be suspicious and fearful of all that robs the land of men, and robs labor of its primal importance in material life. We shall think out, and try out, and establish more enduring economic systems as we go on about our work, than we shall ever be able to do sitting idle with our heads in our hands trying to "think" a new world system out of our brains.

The day's work is the hub around which the whole wheel of earth-life swings. It must be kept central, both in our thinking and our action. Any system that shunts the day's work off to one side as unimportant, is riding to a fall.

U.S. SCRAP METAL

The coal strike effects are apparent in some districts, while others are untouched. Prices are higher in some cases. Following are reports from various centres:

CHICAGO.—Although a number of plants have had to close down, due to a shortage of coal, the scrap market remains strong. Foundry grades retain their strength and No. 1 wrought is a good feature. Railroad offerings amount to about 6,500 tons.

BOSTON.—There has been a general advance in the New England district, and the past month has been the best month for business of the year. Re-rolling rails have sold at $27 shipping point. Heavy melting steel will bring $17 if of good quality. Wrought pipe is at $18, and No. 1 machinery is $34.50 delivered.

NEW YORK.—There has not been much trading, but several grades have advanced. Heavy melting steel is at $18 to $18.50 f.o.b. New York. There is considerable buying by brokers, but not much selling.

PHILADELPHIA.—Heavy melting steel is strong in this district. Some heavy tonnages have been sold at $24.50 delivered, and one lot of 5,000 tons was sold at $22.50 delivered.

PITTSBURGH. — The coal shortage is affecting the market here. Several melters here have asked suspension of shipment against orders. This has had the effect of checking what was a strong upward market. Heavy melting steel is being quoted at $26 to $27 delivered.

BUFFALO.—Heavy melting steel is unobtainable in this market, although $23.50 has been offered. Dealers are holding on to their stocks and expect a further rise in this grade.

CLEVELAND.—The market here is weak, and not much change is expected till the New Year. Consumers are out of the market, and while prices are unchanged they are merely nominal.

CINCINNATI.—The coal shortage has resulted in the closing down of a number of steel mills. Dealers' stocks are increasing and the market is in consequence shewing signs of weakness.

ST. LOUIS.—Business is very light, the coal situation having had its effect, several consumers having asked suspension of orders. Prices are firm with advances in some cases. Heavy melting has advanced $1 to $22. Re-rolling rails have advanced $1 to $32. Cast scrap and malleable are in demand.

CIRCUIT BREAKERS DISCUSSED

The circuit breaker is a most important piece of apparatus in power plant design, and upon its successful functioning depends in large measure the size attainable in generating stations and their safe operation.

The rupturing capacity of an oil switch is one of the most important features of design with the rapid growth of power systems. Circuit breakers installed some years ago have been found to be totally inadequate in this important particular. The limitations of space as imposed upon the manufacture by the engineers in charge of station design often work to the detriment of successful breaker design, and it becomes necessary for the designer to make the breaker fit the job instead of being free to do what his best judgment dictates. A new type circuit breaker was described by G. A. Burnham, chief engineer of the Condit Electrical Mfg. Co., Boston, in a paper read before the Toronto Section of the A. T. E. E. at the Engineers' Club, on Friday evening, December 5. This breaker has been developed to take the place of other circuit breakers of a lower rupturing capacity and in design possesses some novel and interesting features. The structural design of the tank supporting parts has been very much strengthened and they are made of cast steel or malleable iron. They have been designed for a pressure of 40 pounds per sq. in. The tank is double and consists of an inner shell, which slides up inside a deep projecting lip on the top. The outer shell passes up around the outside of the lip, although only for a short distance, since it is some inches shorter than the inner one. On the occurrence of a severe short circuit or other disturbance, causing the breaker to trip open, the contacts separate in the usual manner and the pressure exerted by the ignition of oil vapors and by the arc itself is relieved by means of the spring suspension. The movement downwards of the tank, which is 1 1-16 in. for 40 pound pressure, also absorbs much of the shock on account of the inertia effect of the moving parts.

On the conclusion of the paper an animated discussion took place relative to the merits of the new device and related to circuit breaker troubles in general.

France Adopts Oil Fuel.—Trials have been made on an old locomotive on the leading French railway, with a view to ascertaining the possibility of burning oil instead of coal under the boilers. The trials have proved so successful that two hundred locomotives are being fitted with the burners for the new fuel immediately.

Electric Club Lunch.—The Electric Club held a most successful luncheon in the Mossop Hotel, Toronto. There were representatives of nearly every electrical company in the city present and the dining hall was not big enough to hold them. A very interesting address was given by T. W. Gordon, of the General Electric Company of Schenectady, on "Thrust Bearings."

War Plant for Sale.—The munition plant of the Ker & Goodwin Company, of Brantford, which was just about completed at the time of the armistice, is being placed on the market. Negotiations for its purchase have been opened by the Brantford Cordage Co., according to a report from that city.

The death is announced from Sarnia of Malcolm McPherson, at the age of 72 years. Mr. McPherson was well known on the Great Lakes, where he sailed for many years. He was buried at the Union Cemetery, Mooretown.

Ottawa.—The "Canadian Recruit" was the last vessel to leave Montreal for the season of 1919 with a cargo. The "Canadian Planter" is still at Vickers' yard, but will be completed and sent down to Quebec to be loaded. The Elder-Dempster liner "Bassa" is still ashore, and the work of lightening her is proceeding. Fear is entertained that she may be compelled to remain in the river all winter if not speedily floated.

Sarnia.—Released from a bar where she had gone ashore a day or two previously, the tug Annie Moiles turned over and sank. Six men were aboard of her when she turned over, but all made their escape in safety. The tug went ashore while towing the scow Ontario.

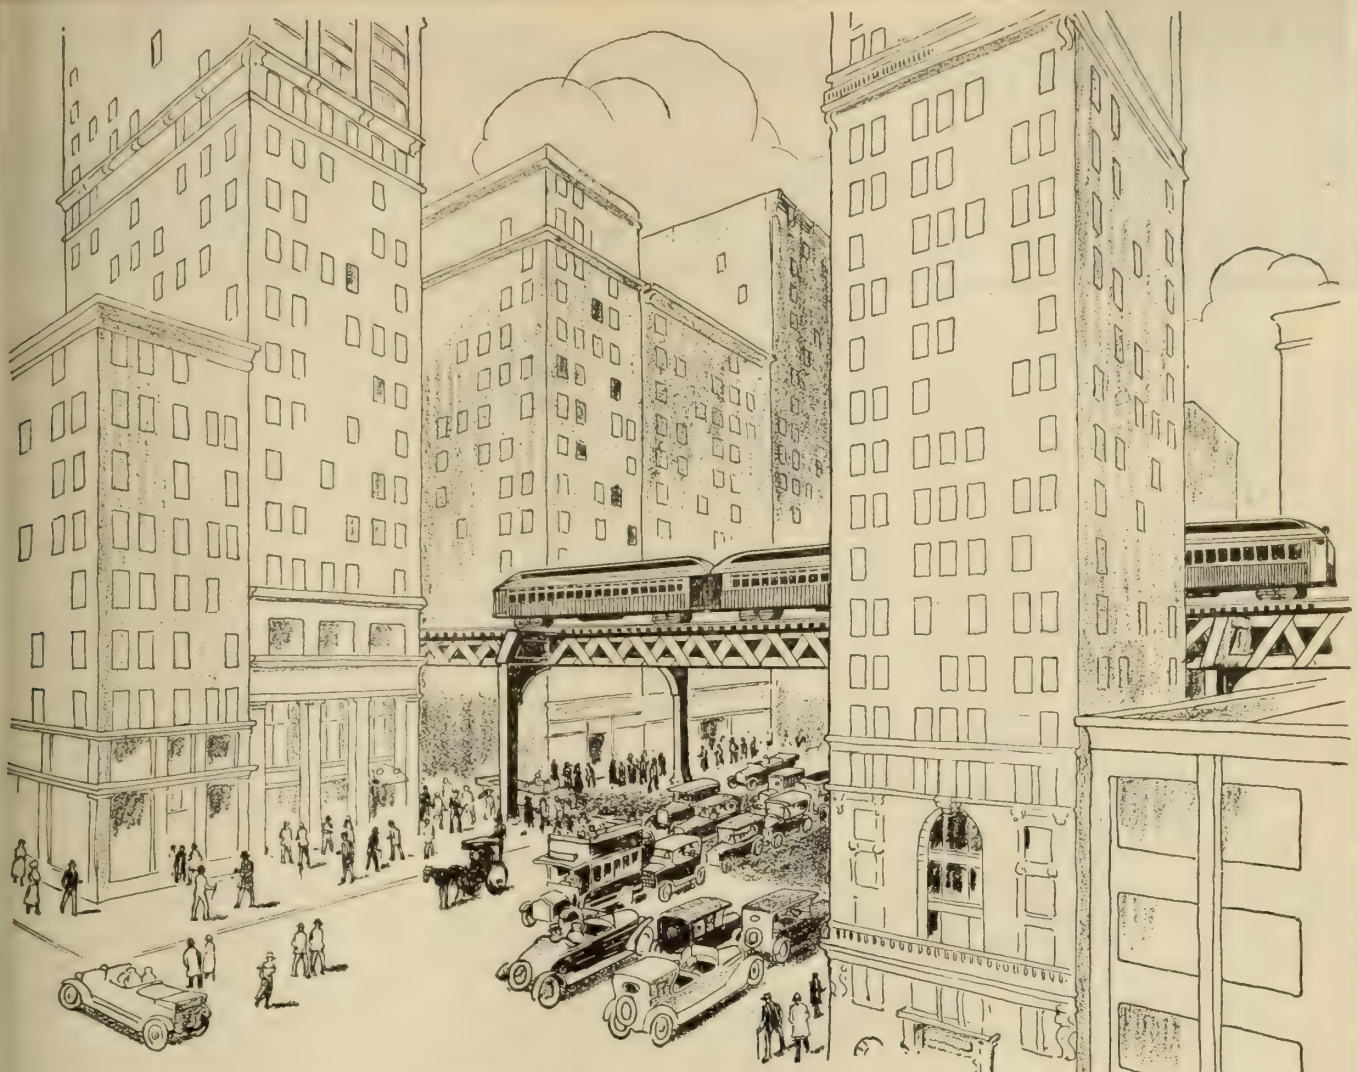
HE'LL TELL THE WORLD

Williams in Indianapolis "News."

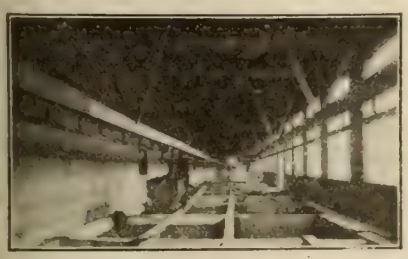
Vancouver.—The first of the fou steamers being built in the Coughla yard for the Canadian Merchant Marin was launched successfully. She is vessel of 8,100 tons, and was christene the "Canadian Importer." The sponso was Mrs. Cooper, the wife of the Fe eral member for South Vancouver. Sh will be the first vessel of the Canadia Merchant Marine to take the regul sailings for Australia.

Wrecking at Leaside.—The work demolishing the tool house at the Le side ammunition plant, the property the United States Government, is bein rapidly proceeded with. The buildin which has a frontage of 40 feet by 1 feet in depth, is being sold piecemeal fast as it is pulled down. The Leasi town council are in communication wi the Federal Government with a view saving the main building, which co $3,000,000 to build.

The Richardson-Phenix Compan Milwaukee, have again opened the Philadelphia office and placed it in th charge of Mr. Geo. F. Fenno. M Fenno has been associated with the Ric ardson-Phenix Co. for ten years and h recently been released from the Gover ment service, where he was in char of the conservation of lubricants for t department of military aeronautics.



Have An Elevated Railway In Your Plant



When New York could not find room for all her traffic on street level **she carried it overhead.**

Land is too valuable in these days for floor space to be wasted. The passages in your factory have all the traffic they can accommodate.

Why not use the space on the ceiling?

By using an overhead conveyor you will save congestion on the floor. The men can handle bigger loads at a time, without risk of blocking the passages.

Every factory or warehouse is a miniature New York! There is more traffic to be accommodated than floor space will comfortably handle! An overhead conveyor will relieve the congestion and utilize space that is going to waste.

BT TIME SAVER

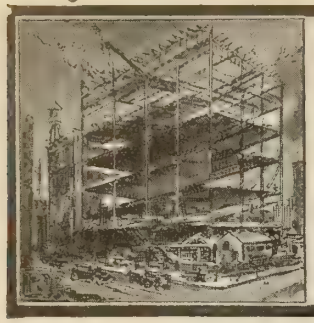
BT Overhead Conveyors

BT TIME SAVER

All kinds of buildings throughout the Dominion have been fitted with BT Conveyors, from small garages and machine shops to big steel plants and factories. We have track, hangers, switches and the necessary fittings for any building. From big bars of steel to loads of leather scrap, we have designed carriers to convey products of all kinds. Complete information is yours for the asking. It will be a pleasure to go into the matter with you and help you to decide how to arange a conveyor outfit for your plant. A card will bring full details, without obligation to you, of course.

BEATTY BROS., LIMITED Head Office: Fergus, Ont.

Branches at: Winnipeg, Man., Edmonton, Alta., Montreal, Que., St. John, N.B.



INDUSTRIAL NEWS

NEW SHOPS, TENDERS AND CONTRACTS PERSONAL AND TRADE NOTES

TRADE GOSSIP

Lignite Plant in Manitoba.—A plant for the manufacture of lignite fuel will be erected in the spring near Bienfait, Man., on the C.P.R. This was announced by J. M. Leamay, Provincial Commissioner. The buildings will all be of steel.

C.N.R. Confiscates Coal.—St. John, N.B., coal dealers are having their stocks cut down by confiscation by the Canadian National Railways. The railway has power under an order-in-council to take what coal they require and pay the dealer the mine price.

Privy Council Awards Share.—The proceeds of the sale of the steamer "Storstad," which sunk the Empress of Ireland, will be shared by the C.P.R. The Canadian Supreme Court gave the preference to the passengers, but the Privy Council reversed the decision.

Start New Bridge.—Work on the construction of the new bridge over the Niagara River will commence this month. Representatives of the Canadian Niagara Bridge Company have arrived at Black Creek, six miles from Bridgeburg, and will start work preparing for the abutments as soon as the necessary machinery arrives.

Mechanics Go To States.—The officials of the Metal Trades and Building Trades Unions are seriously worried by the growing shortage of men, due to so many of them going across the border. A good many men who went there during the strike here have failed to return. More are going now, being attracted by the high rate of wages.

Canada Iron Foundries' Report.—The Canada Iron Foundries' report shows the effect of making the readjustment from war-time to peace conditions. The earnings for the year ending September 30 show a decrease from those of last year. They were $489,943, compared to $580,824 in 1918. An additional sum of $99,098 was secured from interest discount and exchange which brought the total to $595,908.

Clergyman on Conciliation Board.—The appointment of the Rev. Clarence McKinnon to the Board of Conciliation dealing with the dispute between the Dominion Coal Company and its employees at Glace Bay, is the first instance of a clergyman acting on a board under the Lemieux Act. Mr. McKinnon will act as chairman of the board, J. C. Watters will represent the employees, and Col. W. E. Thompson the coal owners.

Toronto Engineering Institute.—An interesting lecture on sound ranging of heavy artillery in France was given by Captain Roy Cockburn at a recent meeting of the Institute at the Engineers' Club. The election of officers was also held, the result being as follows: Chairman R. O. Wynne Roberts; Committee men: Geo. T. Clarke T. Taylor, Prof. C. R. Young and J. C. Krum.

Will Stop Export.—An official of the Canadian Railway Board speaking recently said that even if the coal strike was settled there was little chance of any coal reaching Canada during December. Railways are already using wood fuel for their stationary boilers, and have reduced their passenger service, and there is no doubt that a serious curtailment of freight trains will ensue.

Big Convention for Toronto.—The next convention of the International Machinists' Association will be held in Toronto, in all probability. The date fixed is September, and about 3,000 delegates will attend. The convention will last about three weeks, and business to the amount of $400,000 will accrue to the city if Toronto's invitation is accepted. Acceptance depends on the ability of the city to accommodate the delegates.

Secure Contract. — The MacKinnon Steel Co., Ltd., of Sherbrooke, Que., has been awarded the contract for the steel superstructure of the highway bridge which the Government of the Province of Quebec has arranged to erect over the Batiscan River at Batiscan, Que., on the Montreal-Quebec highway. This bridge, which is over twelve hundred feet long, will be one of the largest highway bridges in the Province of Quebec.

$1,000,000 Arena For Montreal.—An arena with seating capacity for 6,000, and standing room for 6,000 more, will be built and ready for hockey on January 15th next. The location will be near Windsor and Dorchester street. The building will include a garage. The capital will be $2,000,000, the shares being of $10 each, so that opportunity will be given to all sport lovers to subscribe.

Hamilton as an Ocean Port.—An association known as the Canadian Deep Waterways and Power Association, has been formed. The object of the association is the promoting of the shipping interest of the ports, and important developments are expected from their activities. The Board of Control of Hamilton are considering a request for a contribution to the funds of the association. Plans for the development of the Hamilton waterfront are nearly ready for presentation to the Board of Control.

Antimony Mine Plant.—The North American Antimony & Smelting Company, a new company with a capitalization of $2,000,000, organized for the developing of the antimony mines of Lake George, York County, N.B., has ordered its machinery. The machinery ordered at present consists of boilers and engine and preparations are being made for the installation of the concentrating plant.

To Boom Municipalities.—An industrial conference will be held next summer, the object of which will be to bring the power facilities of the Niagara district prominently before the world. This was decided on at a meeting of the municipal representatives from all parts of the Niagara district held at Welland recently. The towns concerned are St. Catharines, Welland, Thorold, Niagara Falls, Bridgeburg, Port Colborne, Fort Erie, Stamford, Merritton and Crowland Townships.

MARINE

St. John, N.B.—The new dry dock which is being built at Courtenay Bay, St. John harbor, will be, when completed, the largest dry-dock in the world. It will take two and a half years to complete.

New York.—The "Imperator," the huge ex-German liner, will make her first voyage under the British flag this week. She will carry 600 first, 400 second, and 1,500 third cabin passengers. She will receive sufficient bunker coal for the voyage to England.

Ottawa.—Recommendations for improvements to Vancouver harbor, presented to Mr. Ballantyne, include a modern 1,300-foot wharf on Burrard Inlet, a car ferry service between Vancouver and North Vancouver, and a terminal railway system. The improvements would run into several million dollars.

Port Arthur.—A wireless was received from the steamer "Collingwood" that she had been forced to go for shelter behind Kewwanaw Point. A severe storm was raging on Lake Superior and several other boats were also seeking shelter at the same time. The weather at the time was quite fine at Port Arthur.

Sault Ste. Marie.—There were several big freighters caught in the ice in Mud Lake recently, a most unusual occurrence for the time of the year. Mud Lake is just below Sault Ste. Marie. The vessels were the "Martian," "W. Grant Morden," "Odanah" and "Midland King." A tug was necessary before they could be released.

Ottawa.—The Government have now received and commissioned eighteen of their fleet, and they will have before the

WHEN WRITING ADVERTISERS KINDLY MENTION THIS PAPER

end of the year twenty-two in active service. The "Canadian Aviator," built in Vancouver, will shortly leave for Australia with a cargo of paper, and the "Canadian Volunteer" and "Canadian Trooper" have sailed for Great Britain by way of the Panama Canal.

Ottawa.—The two ships recently ordered from the Wallace Shipbuilding Co. in Vancouver, bring the Dominion Government fleet up to fifty-seven ships. There are about 20,000 men employed in the various yards of the country and there are about the same number employed in the contributory trades. Canada has an investment of $47,000,000 in her shipyards. The two latest vessels are of 8,350 tons.

New York.—The people of the Eastern states are not feeling very kindly towards the move to deepen the St. Lawrence canals and open up the lake ports to ocean navigation. They are of the opinion that such a move would be to the detriment of the Atlantic ports of the U.S. and a benefit to Canada only. This is not in accordance with their wishes, and they will oppose strenuously any participation by the United States Government.

Masters, Mates and Pilots.—The National Association of Masters, Mates and Pilots have joined the Trades and Labor Council. The National Association, which was organized in the States last March, has now eighty-nine harbors, or as they would be called ashore, locals. Montreal, Kingston, Quebec and Toronto have harbors, and many more will be formed shortly. Capt. W. Stitt is president of Toronto Harbor No. 68. Capt. John Strain, of Buffalo, is business manager of the organization.

PERSONAL

Mr. W. Wheatley, lately elected president of the Armstrong-Whitworth Company of Canada, sailed from Liverpool, Eng., recently on the steamer "Lapland" for Montreal. He will start his new duties in the course of a few weeks, after paying a visit to his native town of Lima, Ohio.

Mr. William Worthington, head of the Sewers Branch of the Toronto Works Department, has tendered his resignation to take effect on December 15. Mr. Worthington will go into private practice as a consulting engineer, after eighteen years spent in the service of the city. This is the fourth of Toronto's department heads to resign recently.

INCORPORATIONS

Incorporation of a $10,000,000 company for Montreal, and of a number of other companies of large capitalization have been gazetted. The principals are: The Oakcoal Company of Canada, Limited, Toronto, capital $1,250,000; Gear Produce of Canada, Limited, St. Catharines, Ont., capitay, $250,000; Librairie Garneau, Limited, Quebec, capital $250,000; Tremblay & Dufour, Limited, Chicoutimi, capital $50,000; Ottawa Farm Journal, Limited, Ottawa, capital $200,000; Trans-Canada Theatre, Limited,

ontreal, capital $3,750,000; Western heel & Foundries, Limited, St. Boniface, Manitoba, capital $2,000,000; Simons, Limited, Montreal, capital $10,000,000; Canadian Nathan, Limited, ontreal, capital $100,000; Canadian acArthur Concrete Pile Company Limited, Montreal, capital $24,000; Charles . Goad Engineering Company, Limited, oronto, capital $300,000; MacPherson Wire Company, Limited, Hamilton, capital $400,000; Canadian Inspection & esting Co., Limited, Toronto, capital 40,000; Edgar Allan & Co., of Canada, imited, Montreal, capital $50,000; Elley Dress Manufacturing Company, imited, Toronto, capital $150,000.

CATALOGUES

The Jeffrey Manufacturing Company, Montreal, P.Q., have issued Bulletin No. 273 which supplements Catalogue No. 244. A line of 10 in. bucket elevators has been added, also chains having reversible steel bushings. A page is given to each Standard Elevator, which is illustrated both in perspective and in line drawing, giving dimensions. Also on each page there is an illustration showing the chain and bucket used on that type of elevator. Below the illustrations are the specifications from which you can easily select the elevator for your needs.

OBITUARY

The death is announced from Brockville of Mr. Sidney Arthur Logan. Mr. Logan had been a resident of the town for 41 years and was a well-known contractor. He was born in Elma, Dundas County, in 1846, his parents being pioneers of that community. He went to Brockville in 1878, and engaged in sewer and waterworks construction.

PIG IRON TRADE

The price of pig iron of all grades is going steadily upwards. In an already strong market, the prospect of curtailment by lack of coal acted as a further strengthener. Following are reports from various U. S. centres:

PITTSBURGH.—The foundry iron market has been quiet lately, but this is due to the furnaces being pretty well booked up for next year, first half. There has been great activity in basic, 40,000 tons of this grade having been sold. The basic prices are $33 valley and Bessemer at $34.

NEW YORK.—The demand for pig iron is strong, and furnaces have sold up at least half their capacity for the first half. This condition is reflected in the rising prices. Eastern Pennsylvania foundry, 2.25 to 2.75 silicon, first half delivery, has sold at $37 and $38 furnace, and 2.75 to 3.25 silicon at $39 to $41 furnace.

BUFFALO.—The three grades of foundry as well as malleable and basic have advanced in price. No. 2 foundry is now $38. Basic is quoted at $36 and malleable at $39.25. Consumers from outside the district have come into this market for iron.

CLEVELAND.—Heavy demand, far exceeding the available supply, characterized the market, resulting in further advances. High silicon iron was sold for $36 for the base grade. Basic has sold for $33 valley furnace. Coal supply is getting very low, and may interfere with production shortly.

CHICAGO.—Producers are practically out of the market, thus applying to both Northern and Southern furnaces. Melters would be glad to place contracts almost regardless of cost. A small tonnage from a Virginia furnace is being offered in the Chicago district at $36 furnace, with a $5 freight rate, and full manganese differentials.

CINCINNATI.—There is not much iron available in Southern Ohio, and the quotation for 1.75 to 2.25 silicon for first quarter delivery is $35 Birmingham. Malleable is in good demand with only a limited quantity to be had.

BIRMINGHAM.—Enquiry is good, and production is not up to normal. Foundry iron No. 2 grade is selling at $35 in one case but generally at $33 to $34. The probability of advanced wages to coal miners is making producers cautious, as this would increase their costs.

PHILADELPHIA.—There is general anxiety on the part of consumers to buy iron, the effects of the coal strike being in evidence already. There are several enquiries for lots of 15,000 for first half. Makers are mostly out of the market, having booked up 50 to 70 per cent. of their first half capacity. Malleable has sold at $37 Eastern Pennsylvania furnace for first half delivery, and basic at $35 Eastern Pennsylvania furnace.

THE "WANT" AD.

The "want ad." has grown from a little used force in business life into one of the great necessities of the present day.

Business men nowadays turn to the "want ad." as a matter of course for a hundred small services.

The "want ad." gets work for workers and workers for work.

It gets clerks for employers and finds employers for clerks. It brings together buyer and seller, and enables them to do business though they may be thousands of miles apart.

The "want ad." is the great force in the small affairs and incidents of daily life.

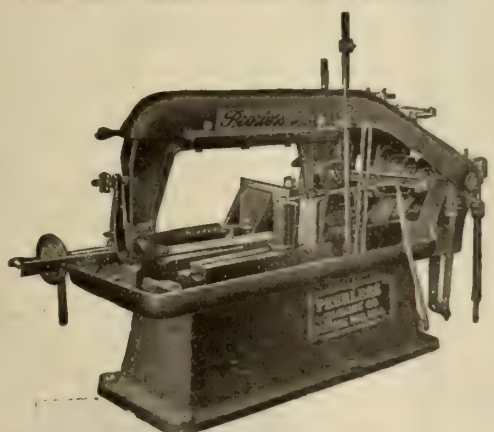
Peerless HIGH SPEED
Thedard Metal Saw of TO-DAY



While labor is demanding more and more, manufacturers are demanding machines of greater output. The "Peerless" meets that demand. It is the standard metal saw of TO-DAY.

With its rapid cut and various time-saving features, it easily increases production from 50 to 100 per cent. With its automatic feed, straight line pull, positive blade clamp and general rigidity, it gets the maximum results of which a blade is capable and reduces breakage to a minimum.

OUR SIX-SPEED GEA BOX

(not shown in cut) further increases output and saves blades wherever soft steel or metals of varying degrees of hardness have to be cut. The "Peerless" is furnished either with or without this feature, also with or without motor.

A trial order at our risk and expense is convincing

MacGOVERN & COMPANY, INC.
275 Beaver Hall Hill - - - MONTREAL

The foreman says.

"I suppose it's because I used them myself when I was at the bench, but it does seem as though the best men in the shop have a preference for Starrett Tools.

"Of course, most of them sort of got into the habit of relying on Starrett for fine work when they were apprentices and journeymen.

"Speaking of apprentices — that little red book there, 'The Starrett Book for Machinists' Apprentices,' has saved me more time and helped more young fellows to learn how to do things right than anything else in the shop.

"When a young lad asks me how to do this or that, I usually tell him or show him, and then ask him if he has one of those books. I've noticed that as soon as he gets one of them he doesn't have half so many questions to ask.

"Starrett gets out another book, 'The Machinists' Data Book,' that's just about as big a help to the experienced machinist. It's got all the tables and formulas and so on that he ever needs, and it isn't cluttered up with a lot of engineers' stuff that he doesn't use.

"Yes, I bought one of each of the books down at the hardware store, as soon as they came out. They cost me seventy-five cents each, but they're worth it."

Nichrome Castings

for Heat Treatment

Cast Nichrome may be machined without great difficulty. With the machined gas sealing cover, furnished with the "Sealtite" pot as shown in the figure, no fire-clay is required for sealing the cover, and the heat treatment penetration shows a large percentage increase over that of iron and steel pots.

According to the noted Italian physicist, Dr. F. Giolitti, carbon monoxide is the most active agent in the cementation and case-hardening of steel.

The taper-fit gas seal of the patented "Sealtite" pot lasts as long as the pot is serviceable. The gases necessary for carbonizing are confined within the container and it has been shown that an increasing depth of case results from the increased gas pressure.

A considerable saving in time and carbonaceous compound has been obtained by some users of the "Sealtite" pot.

Write for further particulars.

Manufactured under Henderson patents.

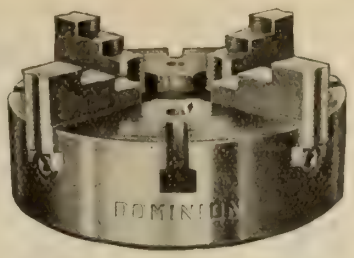
You Try This

When you desire any information on matters pertaining to the trade it will be gladly furnished free upon application through the columns of this paper. If you enclose stamped, addressed envelope we will also reply direct to you. Don't hesitate to ask us. We will do our best.

When writing to advertisers kindly mention this paper.



DOMINION CHUCKS

STEEL OR CAST-IRON BODY
BUILT FOR HEAVY DUTY

All Screws Are Reversible

SCREWS are made of the best grade steel. Both ends are broached and are heat treated after machining. They are reversible, so that either end may be used, are large enough in diameter to stand the torsional strains applied by operator when setting up his work. They are made to give the best service—and may be depended upon to stand up under the hardest usage.

"Machinists Tools" Make Useful Christmas Presents

We have in stock for immediate shipment the highest grade Bar Iron, Black and Galvanized Sheet Iron, Machine Steel, Cast Steel, High Speed Steel, Cold Rolled Steel, etc.

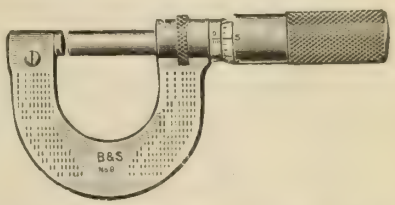
Machinist's Tool Chests

Time and again skilled machinists have remarked on the strength of construction and compact design of our Tool Chests. Have us give you full particulars.

CRESCENT BELT FASTENERS

Clinch beneath the surface of the belt on the pulley side—no part in contact with the pulley. They maintain uniform grip the entire width of belt and never weaken from wear.

Micrometer and other fine tools



Select from such wholly dependable makes as Starrett or Brown & Sharpe, or from other makes you have proven in your own shop to be most durable and efficient. Our stocks are complete.

"Victor" Hack Saw Blades for Tough Metal

Durable, fast-cutting blades that you can rely upon to cut true through toughest metals. Users have found that these blades increase every day's output and serve much longer than ordinary blades.

Write us about your requirements.

Must School Teachers Starve?

By Sir Robert Falconer, President of the University of Toronto

CANADA is threatened with another epidemic—cheap teachers! A grave warning, showing the seriousness of the situation, has been made public, through the medium of MACLEAN'S MAGAZINE.

The financial attractions in commerce and trade are proving such a lure to the clever Normal School and University graduates that public schools, high schools and universities throughout the Dominion are being driven to engage inferior teachers—if they can get any at all! One teacher in Ontario is paid the princely sum of $300 per annum.

The article gives the opinions on this vital topic of such men as: Sir Robert Falconer; Principal R. Bruce Taylor, of Queen's; Dean of Arts W. Sherwood Fox, of Western University; A. P. S. Glassco, Secretary of McGill; President MacLean, of the University of Manitoba; President Klinck, of Canada's youngest university—British Columbia; President A. Stanley Mackenzie, of Dalhousie; and many others.

"The Thread of Flame"

By Basil King

This famous Canadian novelist has written a remarkable story that deals with a man who loses his identity while fighting in France. This strong novel, "The Thread of Flame," starts in the December issue of MACLEAN'S. This is the first occasion that a novel by Mr. King has appeared in any Canadian periodical prior to book publication.

Other Features of the December Number

"Merrie Gentlemen"—By Arthur Beverley Baxter.
You will think this the best Christmas story since Dickens' "A Christmas Carol."

"Capital and Labor"—By Ralph Connor.
One of a series of articles on "The New Canada and Its Needs."

"Ottawa is Ready for the Worst"—By J. K. Munro.
A humorous and pithy review of events at the Federal seat.

"Better Late Than Never"—By C. W. Stephens.
A bright Christmas story.

"Some Canadian Snobs"—By Montgomery Dix.
A humorous article on some phases of Canadian society.

"A Blighty Christmas"—By Gertrude Arnold.
An article on the way Yuletide was celebrated in a Red Cross Hospital.
And a dozen other articles and stories all of equal interest.

MACLEAN'S will be Twice-A-Month

starting February 1st, next year. An important point to remember. If you want to keep up with things **nationally Canadian,** you'll have to get the MACLEAN'S Twice-A-Month habit.

Over 350,000 Canadian Read

Butterfield

TWIST DRILLS GEAR AND MILLING CUTTERS

(Carbon and High Speed Steel)

Quality

Prompt Delivery

They're the happy result of a great combination of specially trained men and the finest special machinery—these Butterfield carbon and high-speed steel Twist Drills, Gear and Milling Cutters, Side Mills and End Mills, with straight or spiral flutes and plain or nickeled teeth. Their ability to serve accurately and long equals that of Butterfield Taps, Dies and Reamers — the sincere praise of a thousand users wouldn't be a better recommendation.

The Butterfield Catalog, just off the press, fully describes these better tools and how they increase production. Write for your copy.

Tiresome, Expensive, Dangerous, Wasteful—but Unnecessary.

With Bowser Equipment One Man Does the Work with Less Time and Effort —and Without Loss

STOP WASTING LABOR IN HANDLING OILS

Do away with the back-breaking, disagreeable labor in storing and handling oils.

With Bowser Storage Equipment the heavy work is done mechanically—there is no wasted energy—all oils are easily and quickly put into storage by gravity.

Save With BOWSER Systems

Distribution is done by accurate, rapid self-measuring pumps—no oils are left in shipping containers to dry up, leak and seep away—none is lost through spilling or dripping faucets. Every operation in the use of oils is done in a systematic, safe and saving manner.

Write us for literature, showing why Bowser Systems are a paying investment

Try It Yourself

The best argument in favor of throwing away files the moment they become dull is to try filing a job yourself with a dull file.

If it makes you irritable, think what effect it must have on a man who has to file all day long.

Don't let your men work with dull files. Tell them to turn them in when they become dull.

When buying, specify Famous Five Files. You get a good run of sharp service from them because each file is accurately cut, well balanced and properly hardened.

W. S. ROCKWELL CO. INDUSTRIAL FURNACES NEW YORK

"We Will Locate There"

THIS is the decision of every manufacturer who really goes into the facts about Hull. After having investigated Hull—and having carefully considered its exceptionally advantageous conditions, there is but one verdict.

Hull's growth has been as steady as it has been sure. The prosperity of its industries has been in some cases phenomenal. It makes a definite appeal to industrial concerns.

Hull wants more industries.

If you have a growing business, and you are progressive, Hull's City Council will give you greater co-operation than you can secure anywhere else in Canada.

Here are some facts about Hull:

Hydro-Electric power as low as $12.00 per H.P. per year

Plenty of labor (population 200,000 within 2½ miles).

Low fixed assessment on land for 15 years.

Low tax rate.

Tax exemption for 15 years on improvements.

Cheap factory sites including water-front sites with private power development privileges.

Shipping facilities over 11 steam railway lines and by river and canal to the seaboard and great lakes.

Located in the most populous part of Canada, midway between Quebec City and Windsor or Detroit.

And there is much more you ought to know about Hull. Let us explain in detail. All information will be given cheerfully on request. Write to the

Industrial Commissioner
HULL - CANADA

Canadian Machinery BUYERS DIRECTORY

If what you want is not here, write us, and we will tell you where to get it. Let us suggest that you consult also the advertisers' index facing the inside back cover, after having secured advertisers' names from this directory. The information you desire may be found in the advertising pages. This department is maintained for the benefit and convenience of our readers. The insertion of our advertisers' names under proper headings is gladly undertaken, but does not become part of an advertising contract.

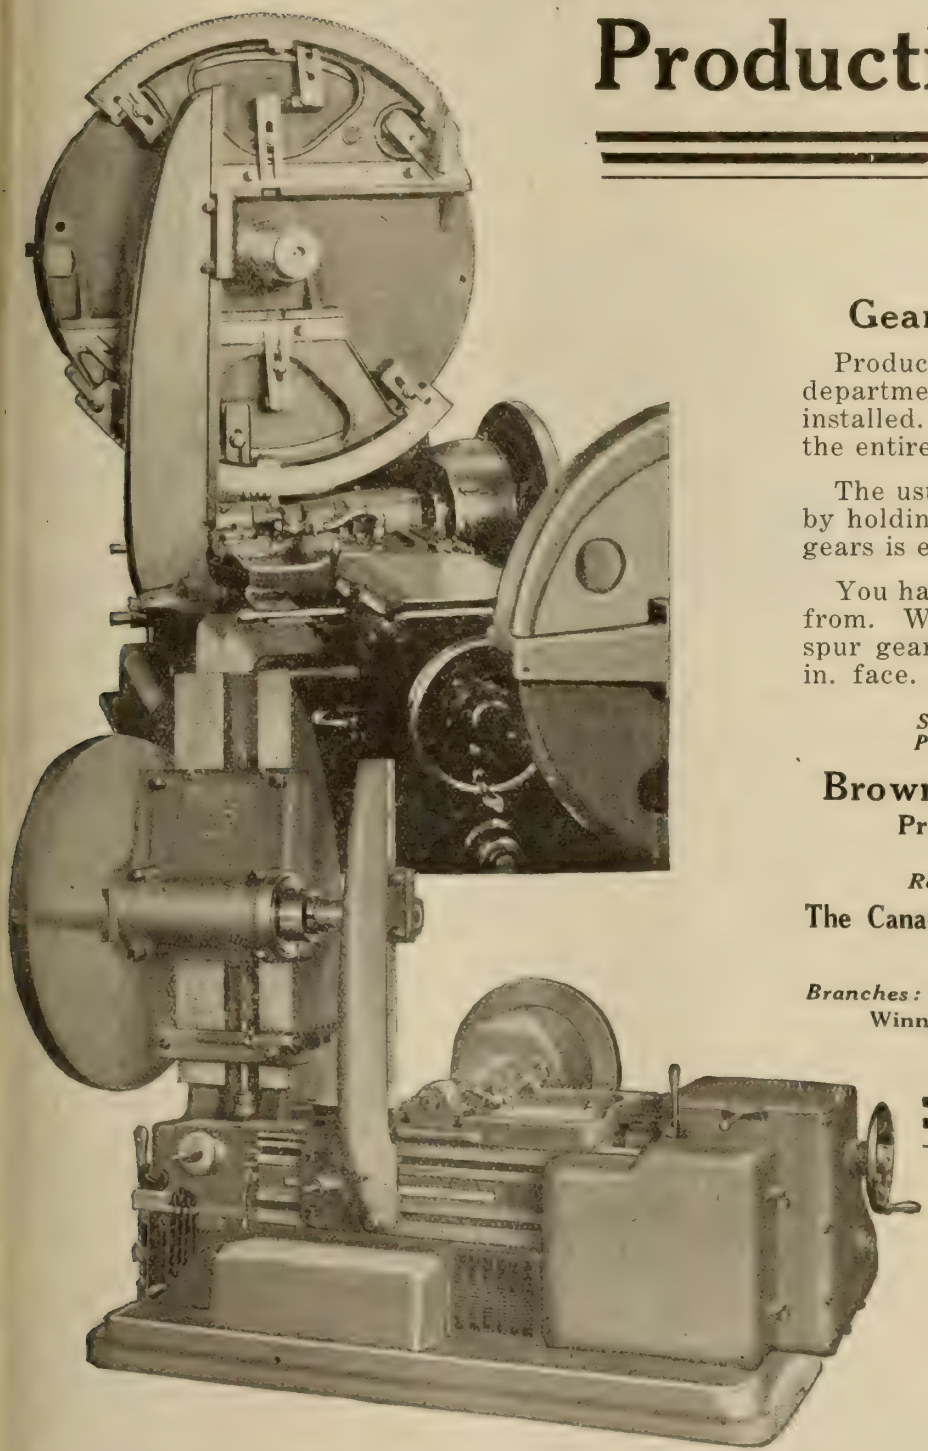
An Incentive To Greater Production



Spur Gear Cutting Machines

Production figures go up in every department when the first machine is installed. Its speed is felt throughout the entire shop.

The usual delay that is experienced by holding up the job for one or two gears is eliminated.

You have a variety of sizes to select from. We build machines for cutting spur gears up to 72-in. diameter, 13-in. face.

Send for Catalog No. 136
Presenting our entire line.

Brown & Sharpe Mfg. Co.
Providence, R. I., U.S.A.

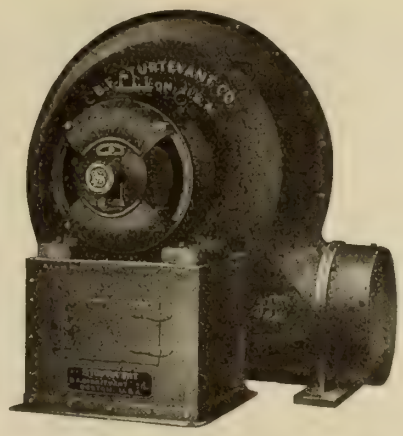
Sturtevant
(TRADE MARK)

MONOGRAM BLOWERS



Aid Manufacturing Processes

—in a thousand ways. They are adapted to ventilating rooms, exhausting chemical and acid fumes, drying, supplying air to forges and furnaces; in fact, any industrial problem where large volumes of air are required. Constructed like a battleship —they stand wear and tear, which many applications require. We carry a large stock and can ship without delay. Call upon any one of our twenty-three Branch Offices to help solve your problem. Bulletin 242 gives a comprehensive idea of these blowers. Asking for a copy involves no obligation.

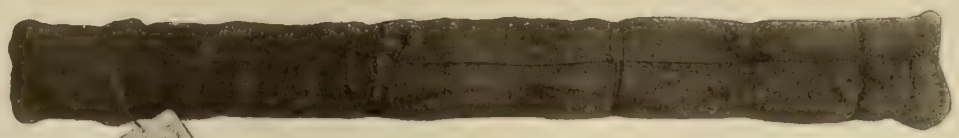
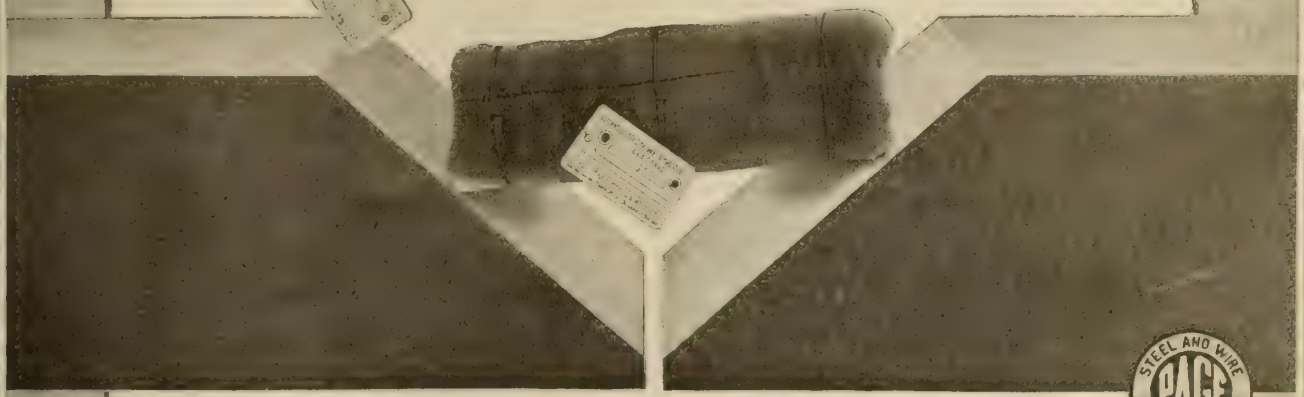
The *Guaranteed* Welding Wire

ARMCO IRON WELDING RODS

For Oxy-Acetylene Welding



For Electric Arc Welding



All authorities since the first application of oxy-acetylene welding have agreed that the best welds are secured by the use of Pure Iron.

ARMCO IRON is guaranteed 99.84% pure iron and is positively the purest commercial iron in the world.

Practically all electric welding wire specifications for mild steel welding state that the maximum total of impurities—carbon, manganese, phosphorus, sulphur and silicon (five elements)—must not exceed 91/100 of 1%.

ARMCO IRON is analyzed for **nine** elements, including oxygen, hydrogen, nitrogen, and copper, and even then the total impurities do not exceed 16/100 of 1%.

Therefore, ARMCO IRON Welding Rods flow freely, weld evenly, and lend themselves perfectly to finishing operations.

Our nearest branch office will give you the addresses of ARMCO distributers in your locality.

PAGE STEEL & WIRE CO.

Established 1882 as Page Woven Wire Fence Co.

The trade mark ARMCO carries the assurance that iron bearing that mark is manufactured by the American Rolling Mill Company with the skill, intelligence and fidelity associated with its products, and hence can be depended upon to possess in the highest degree the merit claimed for it.

Makers of ARMCO Iron Welding Rods and Electrical Wire; "Copperweld" Copper Clad Steel Wire; Wire Mill Products, Plain and Galvanized; Wire of Special Analysis; Wire Fencing for all Purposes; Factory Gates; Ornamental Iron Fence; Machine Guards; Tool and Stock Room Partitions; Architectural Iron.

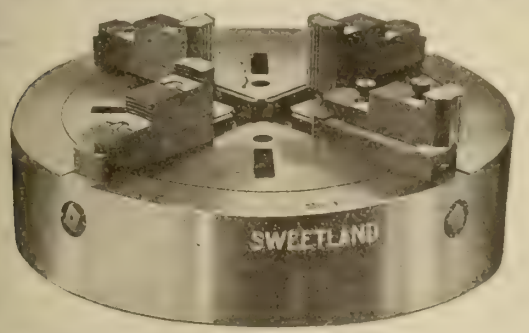
SWEETLAND CHUCKS

Another strong member of the "Sweetland" family. Our combination chuck, which all practical mechanics consider the best Grand Screw Chuck made. It is built



from the simplest possible construction, but still complete in its interchangeability from independent to universal operation of the jaws, or vice versa.

Our 12C Catalogue will prove to you the worth of Sweetland Chucks

The Hoggson & Pettis Mfg. Co.
New Haven, Connecticut, U.S.A.

Sold by Geo. F. Foss Machinery & Supply Co., Ltd.
305 St. James Street, Montreal

We wanted something original— this is what we got

"BOTH in these operations and half another — I'll show you later — completed in the time our old taps took to do one; that, I guess, is why we continue to use your Victor Collapsible Taps."

It was the often-heard story of time saved, of costs lowered, of all threads clean and smooth. And it was pleasant to hear.

Victor Tool Company
Waynesboro, Pa.
U.S.A.

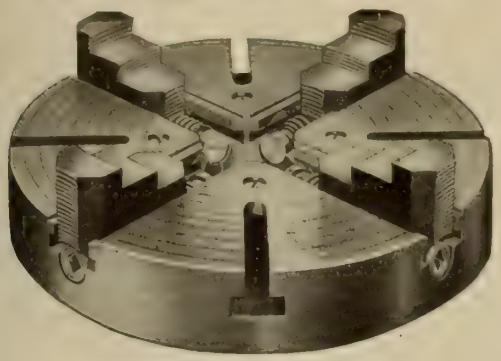
ALL STEEL

INDEPENDENT CHUCKS

are not an experiment—they have come to stay. They are a necessity with the modern machinery and high-speed steel cutting tools.



THE UNION STEEL BODY CHUCKS

are well designed and have all the elements of strength and durability for which they are designed. We make other types in steel also, including the Geared Scroll Chucks and the Geared Scroll Combination—all designed for heavy work and hard usage.

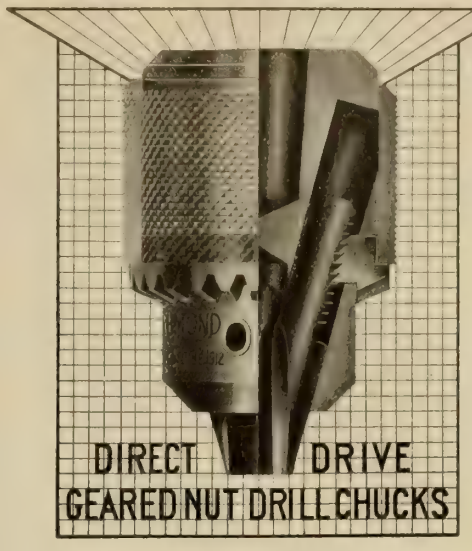
UNION MANUFACTURING COMPANY

New Britain, Conn.

New York Office: 26 Cortlandt Street

Makers of a complete line of chucks

ALMOND



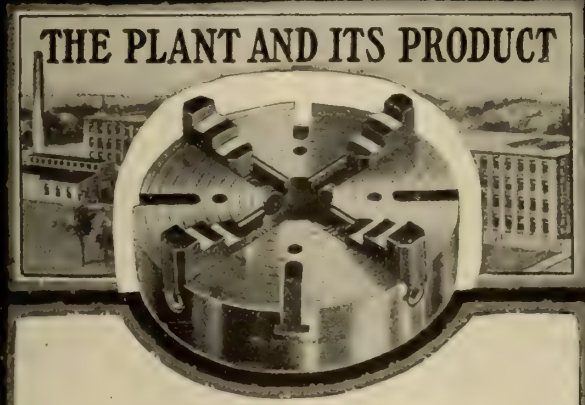
TEETH cut on the nut giving DIRECT DRIVE and the hardened steel Pinion Bushings which prevent wear, insure long life.

OTHER ALMOND PRODUCTS

LATHE CHUCKS, RIGHT ANGLE TRANSMISSIONS, MICROMETER CALIPERS, FLEXIBLE STEEL TUBING

T. R. Almond Mfg. Co., Ashburnham, Mass.

THE PLANT AND ITS PRODUCT



SKINNER CHUCKS

Whether the work requires a powerful chuck with accurately adjusted, easily operated, effective jaws that grip and hold large work—or a small chuck for delicate and unusually precise work—there's a chuck in the Skinner Line that will best meet the requirements.

Our illustrated literature will interest you--

JACOBS CHUCKS

Jacobs Improved Drill Chucks do their part. They never disappoint the mechanic---no drill breakage ---no lost motion.

Equip all your machines with them.

ADDRESS DEPARTMENT C.M.

THE JACOBS MFG. CO. HARTFORD, CONNECTICUT, U.S.A.

H & G

Die Head Cuts
Perfect Threads

The H. & G. Die Head illustrated is only 3⅝" outside diameter, yet it will cut from the smallest up to 1" standard thread and up to 1⅛" fine threads. For absolute proof of its ability to stand up and give good results, see the perfect threads it cuts on nickel steel. You can see these many places, but in almost any automobile or areoplane plant for certainty.

Made in 9/16", 1", 1½" and 2" sizes.

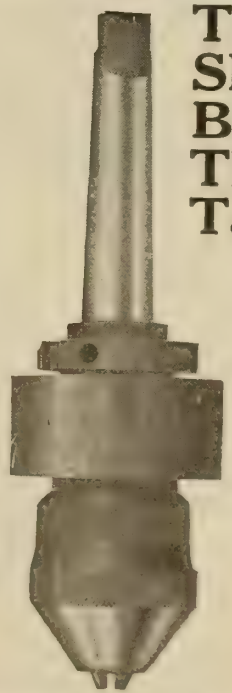
No stronger, more durable, more accurate Die Head was ever made.

on Nickel Steel

Ask for Catalog

Eastern Machine Screw Corp.

New Haven - Conn.



The Saving Slip of the Bicknell-Thomas Tap Chuck

is its most important feature. Powerful enough to drive the tap under all ordinary conditions, the friction slips before enough strain can develop to break it. Compact — invaluable on multiple spindle machines. Adaptable — ideal for tapping blind holes.

Made in four sizes — from ⅛ to 1 inch taps. Straight or Morse taper shanks.

Let us send the Circular

(Photograph and data by courtesy of our customer)

Roasters 18 x 12 x 4½ deep from 24 gauge pickeled and annealed steel at 350 per hour.

Sold in 1898

A "Bliss" No. 14 Toggle Drawing Press. It is here being run at 7 strokes per minute, the operator catching 85 per cent. of the strokes.

The owners bought their first "Bliss" Press in 1871, and to-day our records show the purchase of 66 "Bliss" presses of various kinds. It is neither our longest nor greatest record for a single customer, but it has been maintained with characteristically mutual respect and satisfaction.

BRISTOL

Bristol 12-inch Rotary Precision Surface Grinder

Built for rapid production on grinding work.

It handles work either singly or in multiples within the capacity of the chuck and not thicker than 6-in., and grinds within quarter thousand in. of manufacturing accuracy.

And it is built to last.

It is provided with exceptionally long bearings throughout, especially in the back column. This prevents the wear, which is very slight, from affecting the accuracy of the grinder. The Back Column is made to swivel four degrees, which allows concave or convex grinding.

Bristol Rotary Surface Grinders are made in several types and sizes and are regularly equipped with 8-in., 12-in., and 16-in. magnetic chucks, either belt or motor driven and for dry or wet grinding.

Our Bulletin describes the many good points fully. Send us your name and address and we'll gladly mail you one.

Grinds within .0004 in. of absolute Accuracy

HENDEY IMPROVED CENTERING MACHINE

Assures Perfect Results at Low Cost

The distribution of metal insures the maximum strength with the least weight of machine; in this manner we have conserved on material and hence on machine cost.

Here are a few of the **Hendey** Improved Centering Machine features:—

The head is rigidly clamped to the bed, giving permanent alignment of spindle. Spindle is large in diameter with ample bearings, having felt oilers. Front journal is made taper, after the well-known pattern of our lathe and milling machine spindles.

Jaws of vise and supporting block are made of steel, hardened and ground.

Capacity of machine is from 5-16 to 4 inches inclusive.

The Hendey Improved Centering Machine has many more points of interest. May we send you full description?

Hendey centering machine on centering work in plant of Can. General Electric Co. on all sorts of portions of their product.

CANADIAN AGENTS: A. R. Williams Machinery Co., Toronto, Ont.; A. R. Williams Machinery Co., 260 Princess St., Winnipeg; A. R. Williams Machinery Co., Vancouver; A. R. Williams Machinery Co., St. John, N. B.; Williams & Wilson, Montreal

Foss QUALITY Foss SERVICE Foss

Foss

The Distinctive Rigidity

of the "Mueller" Radials, one-piece, patented column, reinforced with four internal webs; and the long bearing of the arm of this column assures accuracy at the extreme traverse of the spindle even when the arm is at the top of the column. Combination positive, and friction feed, low or high speed friction reverse, unusual operating convenience and other advantages, combine to make it both popular and profitable on a wide range of operations.

One "Mueller" in a plant brings us repeat orders as fast as the expansion of business warrants. The record of each "Mueller" ordered makes the user want more.

Order your MUELLER from *Foss*

You'll get a remarkable combination of quality and service and our own guarantee of absolute satisfaction or money refunded.

Write for full details.

WOODWORKING MACHINERY

FOR IMMEDIATE DELIVERY

We have in stock the following list of New and Second-Hand Wood Tools which we offer for immediate acceptance subject to prior sale

AT SPECIALLY REDUCED PRICES

Quantity	Make	Size		
PLANERS				
2	Sussex		Planer and Matcher, Eastern Monarch	New
1		30"	Cabinet Planer and countershaft	Second-hand
1	Ross	24"	Planer and Matcher	Second-hand
3	Sussex	16"	Buzz Planers	New
1	Goldie & McCulloch		Buzz Planer	Second-hand
1	McGregor-Gourlay	24" x 7'	Planer, single suface	New
1	Falls		Self-feeding Attachment	New
MOULDERS				
1	McGregor-Gourlay	12"	Moulder	Second-hand
1	Cowan	13"	Moulder	Second-hand
1	Gledhill		Moulder for Sash, double table	Second-hand
MORTISERS				
5	McGregor-Gourlay		Mortisers, Power	New
1	Goldie & McCulloch		Mortiser and Tenoner	Second-hand
1	Clark & Demille		Mortiser, Power	Second-hand
TENONERS				
1	Goldie & McCulloch		Tenoner, Blind Slat	Second-hand
1			Tenoner, Wood Frame	Second-hand
1	Cowan		Tenoner, Blind Slat	Second-hand
1	Fay & Egan		Tenoner, Blind Slat	Second-hand
SHAPERS				
1	McGregor-Gourlay		Shaper	New
1	Sussex		Shaper, heavy, with special C/S	New
SANDERS				
1	Peerless		Sander	Second-hand
1	Jackson-Cochrane	48"	Three-Drum Sander	Second-hand
1	Lucas		Sander	New
1	Lucas		Sander, with Extension Carriages	New
SAW TABLES				
1	McGregor-Gourlay		Saw, roller table cut-off, 7' table	Second-hand
1	Goldie & McCulloch		Saw Table	Second-hand
1	Ballantine		Saw Table	New
BAND SAWS				
1	Ballantine	30"	Bracket Band Saw	New
1	McGregor-Gourlay	42"	Self-Feed Band Rip Saw	Second-hand
1	Cowan	36"	Circular Re-Saw	Second-hand
RIP SAWS				
1	Cowan		Rip Saw	Second-hand
1	McGregor-Gourlay		Saw, with countershaft	Second-hand
BORING MACHINES				
1	Sussex		Belt-Driven Post Borer	New
1	Goldie & McCulloch		Post Borer	New
1	Goldie & McCulloch		Spindle Borer	Second-hand
1			Blind Style Borer	Second-hand
SUNDRY MACHINES				
3	Goldie & McCulloch	16"	Single End Wood Lathes	New
1	Jackson & Cochrane		Continuous Feed Glue Jointer	Second-hand
1	Ballantine		12-spindle Dovetailer	Second-hand
1	Sussex	12" x 44"	Veneer Press, 3 screws	New
1	Clark & Demille	12" x 44"	Veneer Press	New
1	Ballantine	12" x 50"	Veneer Press, 4 screws	New
1	Sussex		Double Emery Grinder	New
1	Sussex		Double Emery Grinder, two step cone	New

SERVICE - SALES

High-Grade Machine Tools

MODERN manufacturing conditions demand efficient methods in the factory.

Equally important is the careful selection of the equipment for the factory.

High-grade machine tools of established prestige are the backbone of efficient production.

Equally high-grade representation of these is just as essential and must be coupled with an honest desire to render such service as will most benefit the interests of the user.

The F. F. BARBER MACHINERY COMPANY has been incorporated to fill this need.

We will handle only a restricted number of the highest grade machine tools which have been carefully selected as representing in our judgment the last word in their respective fields.

The personnel of our sales staff will be drawn from men experienced in shop and engineering practice who can in a concise way serve or advise our customers.

OUR whole aim will be to so conduct our business through efficient service and fair dealing as to thoroughly maintain the established prestige of the lines we represent.

HIGH GRADE MACHINE TOOLS PLUS SERVICE

SMALL TOOLS

Pratt & Whitney Adjustable Blade Reamers

These reamers have eccentric relief and can be set to size without regrinding. They are unexcelled for design and simplicity and ease of adjustment.

The eccentrically relieved blades are stronger than others, do not chatter, and produce a smoother hole. The hand, shell and fluted chucking reamers have interchangeable nuts, screws and wrenches. The bottom of a hole can readily be faced.

By a simple adjustment of the blades the reamer can easily be set to size, without regrinding.

Prompt service is assured at our nearest store, where P. & W. Small Tools are carried in stock for immediate delivery. Place your order there to-day.

MILWAUKEE MILLING MACHINES

Double Overarm maintains alignment.

It is impossible for the operator to place the arbor supports on the arbor and double overarm in any other way than in line. Arbor cannot be pounded out of line when using large, coarse pitch cutters on rough, heavy work.

Other Distinctive Milwaukee Features:

Solid top knee—hardened steel gearing and shafts in the column and feed box—automatic flooded lubrication — one and one-half gallons of oil per minute pouring over all gears and bearings in the column and feed box, insuring lubrication at all times—flanged spindle with hardened steel collar for driving arbors—constant speed drive, reverse being self-contained.

Send for our No. 21 Catalogue. Illustrating and describing Milwaukee Milling Machines and accessories in detail

ANNOUNCEMENT

THE ALGOMA STEEL CORPORATION, LIMITED, take pleasure in announcing to their customers and the Canadian trade that in accordance with the widespread desire throughout the Dominion that there should be obtained in Canada with Canadian labor, a much larger proportion of the requirements of this country in STEEL SECTIONS for STRUCTURAL PURPOSES, CAR CONSTRUCTION, SHIPBUILDERS' REQUIREMENTS, etc., they are just completing extensive alterations and additions to their rolling mills, and on or about 1ST NOVEMBER, will be ready to produce and ship American Standard Sections of BEAMS and CHANNELS up to and including 15", all standard sections of ANGLES from 6" x 6" down to 1¼" x 1¼", ZEE BARS for car builders and general purposes, small and large ROUNDS and SQUARES, and FLAT BARS up to 14" wide. The quality of the product is already well known to the trade, and is exclusively steel made by the Open Hearth process. and can be furnished in all grades from the softest rivet stock to high carbon special spring material.

MARK OF ALGOMA O.H. QUALITY

The following are the sections which will be rolled:---

ANGLES—Equal Leg—
6 x 6"—5 x 5"—4 x 4"
3½ x 3½"—3 x 3"
2½ x 2½"—2¼ x 2¼"
2 x 2"—1¾ x 1¾"
1½ x 1½"—1¼ x 1¼"

ANGLES—Unequal Leg—
6 x 4"—6 x 3½"—5 x 4"
5 x 3½"—5 x 3"—4½ x 3"
4 x 3½"—4 x 3"—3½ x 3"
3½ x 2½"—3 x 2½"—3 x 2"
2½ x 2"

BEAMS—
15", 12", 10", 8", 6", 5", 4", 3".

CHANNELS—
15", 13", 12", 10", 8", 6", 5", 4", 3".

ZEES—
3¼ x 5 x 3¼ x 5/16
3 5/16 x 5 1/16 x 3 5/16 x ⅜"
3⅜ x 5⅛ x 3⅜ x 7/16"
3 1/16 x 4 x 3 1/16 x ¼"

WILT

Every Wilt Drill is Thoroughly and Scientifically Inspected Before it is Delivered to You

Every WILT HIGH-SPEED AND CARBON TWIST DRILL is made from the very best materials by highly skilled workmen—THEN they are thoroughly and scientifically inspected after each operation.

This is the best GUARANTEE you can have that the drill delivered to you is as near perfect as it is possible to make a drill. In handling WILT DRILLS you are therefore fully protected and can guarantee to your customer that in selling him a WILT DRILL you are giving him

THE BEST THAT MONEY CAN BUY.

WILT HIGH-SPEED AND CARBON TWIST DRILLS are being used in the majority of the largest plants in Canada —and to a large extent **EXCLUSIVELY.**

IT WILL PAY YOU TO BUY AND SELL THEM.

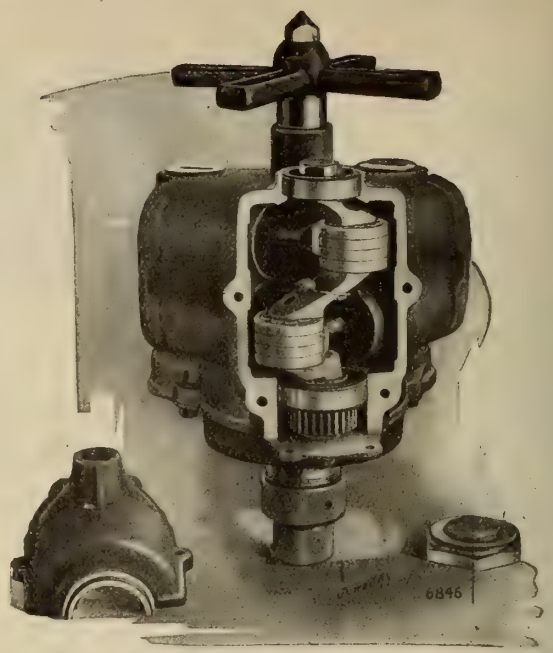
What's Inside Your Pneumatic Drills?

From outside appearances all pneumatic drills are pretty much the same, but it's what's inside the casing that counts.

The internal portions of "Little David" Air Drills, like the works of a Waltham watch, will bear inspection and it's just about as easy to do, all that is required being the removal of a few screws, after which the back comes off, leaving all of the working parts in plain sight.

This is only one of the many good features of "Little David" Air Drills; why not send for the "Little David" bulletins and learn of the others?



"Little David" Air Tools are "Made in Canada"

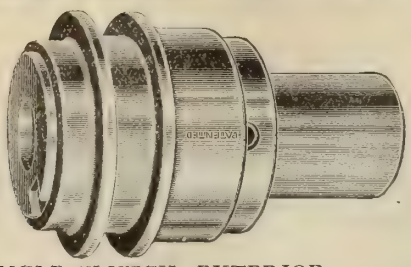
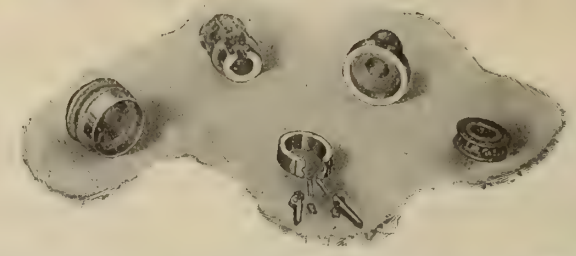
THE JOHNSON FRICTION CLUTCH



SINGLE CLUTCH—EXTERIOR



THE SIMPLEST WAY—AND THE BEST

In a clutch or any other mechanical device, unnecessary complication means trouble. Make a single part serve where two have been used before, and you have reduced by one-half the places that can break, wear or get out of adjustment. Put the cost of **extra** material into **better** material, and you have doubled the length of service.
In the Johnson clutch, this idea has been followed out to its practical limits. The result is a model of simplicity in clutch construction—a few sturdy parts, each correctly built and accurately tested for the duty it must perform. This lack of complication means continuous service and low maintenance cost. Johnson Friction Clutches stay on the job.

Every Emery Wheel With Its Own Dresser

Desirable, isn't it, now that cost is no objection? For with an inexpensive Desmond-Stephan Dresser for every wheel, every wheel will be touched up frequently and so kept true and equal to its original cutting efficiency.

For all ordinary shop grinding wheels specify **"Diamo-Carbo"** —the perfect diamond substitute.

For large, coarse, hard wheels ask for the **"Desmond-Huntingdon."**

Sherman Corrugated, 2 sizes
Norton Zig-Zag, 2 sizes

ALOXITE DISCS AND FAFNIR BEARINGS

ONE thousand outer rings of Fafnir Radial Ball Bearings are faced on both sides with two Alxoite Discs in a ten hour day. The rings are 7.4804 inches outside diameter. The Aloxite Discs used are eighteen inches in diameter in 36 grit.

Fafnir methods of making the splendid Fafnir Bearings call not only for extreme care and accuracy, but for quick efficient methods of production.

So when it came to the proposition of facing the rings,

ALOXITE DISCS MEASURED UP TO THEIR STANDARDS

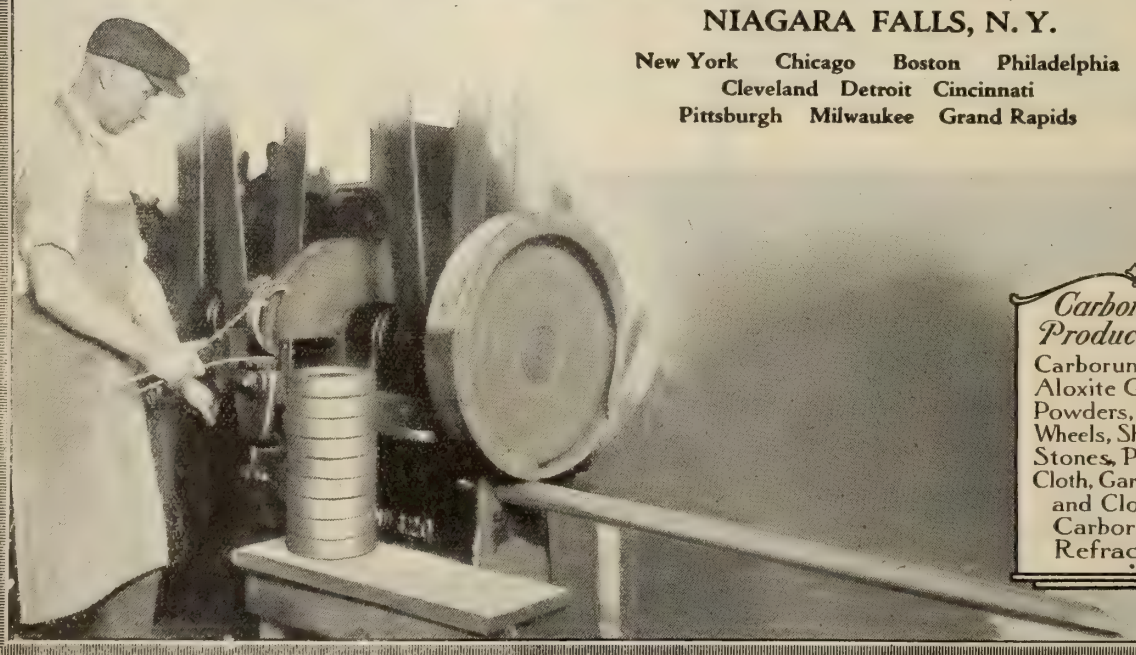
They are Discs that are cut clean and free.
They are Discs that are uniformly coated with hard, sharp, tough, Aloxite Grains and they are built for real grinding efficiency.

Aloxite and Carborundum Discs can be made to definitely meet YOUR Discing conditions

THE CARBORUNDUM COMPANY

NIAGARA FALLS, N. Y.

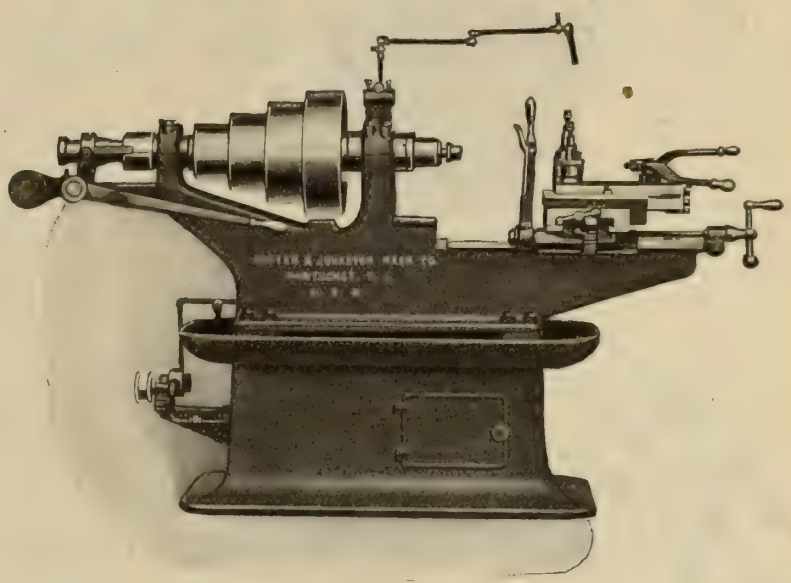
New York Chicago Boston Philadelphia
Cleveland Detroit Cincinnati
Pittsburgh Milwaukee Grand Rapids



Carborundum Products are:
Carborundum and Aloxite Grains and Powders, Grinding Wheels, Sharpening Stones, Paper and Cloth, Garnet Paper and Cloth and Carborundum Refractories

For Second Operation Work

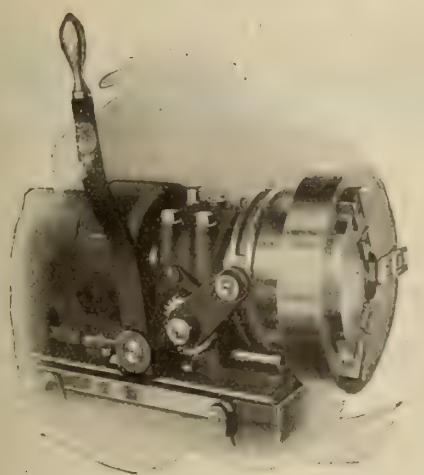
on pieces coming from Manufacturing Automatics or Screw Machines, for such work as squaring up the ends of hubs, rounding out rims of gear blanks and short turning operations, also reducing and rounding the ends of shafts, bolts and screw head, short stud work, etc.



Screw Shaving And Turning Machines

Built in Three Sizes

Number 3 — Number 4 — Number 5



The P & J Patented Automatic Lever Chuck may be applied to the spindle of the numbers 3 and 4 machines, and will be found useful for gripping castings or forgings of all diameters up to 12 or 14 inches, for performing short operations, such as facing, chamfering, recessing, etc.

The Lever Chuck is operated by a hand lever and on pieces which can be inserted into and removed from the chuck, using one hand, it is unnecessary to stop the spindle.

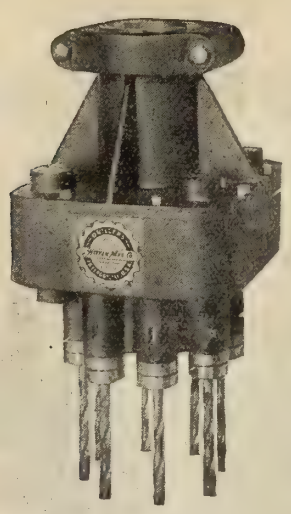
2 Minutes or 20?

This Is The Vital Question



Do you drill ten holes in the time it takes for one? The Hoefer Auxiliary Head equips any driller so as to accomplish this big saving in time. It speeds up production in drilling tremendously. Not only do you save the drilling time, but also the time now lost in shifting the jigs and raising and lowering the spindle for the extra holes.

Hoefer Auxiliary Heads are made in any multiple, arranged in any manner, from 2 up. They are made by expert tool makers and unqualifiedly guaranteed to handle accurately the work for which they are designed.

Investigate now—every day you use a single drill where the multiple may be used you are paying for an auxiliary head through increased costs, but not securing its benefits.

Write for catalog. Send a blueprint of some of your work for estimate of time and cost.

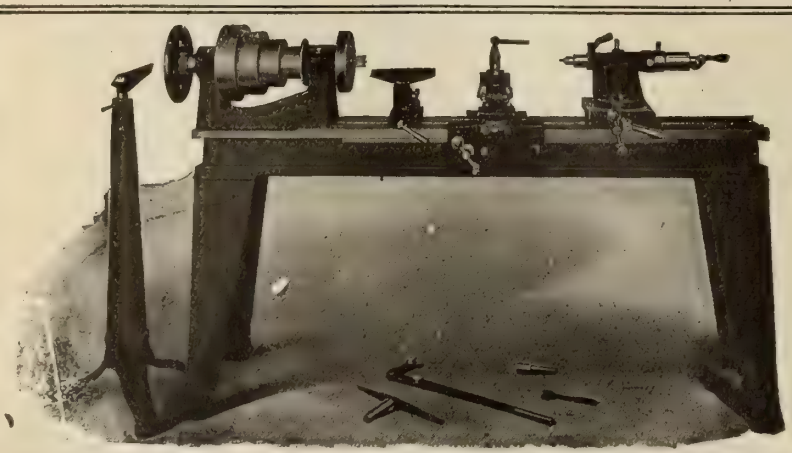
Manufactured by

DIAMOND SAW & STAMPING WORKS, BUFFALO, N.Y., U.S.A.



A Favorite—

Blount Pattern-makers' Lathe

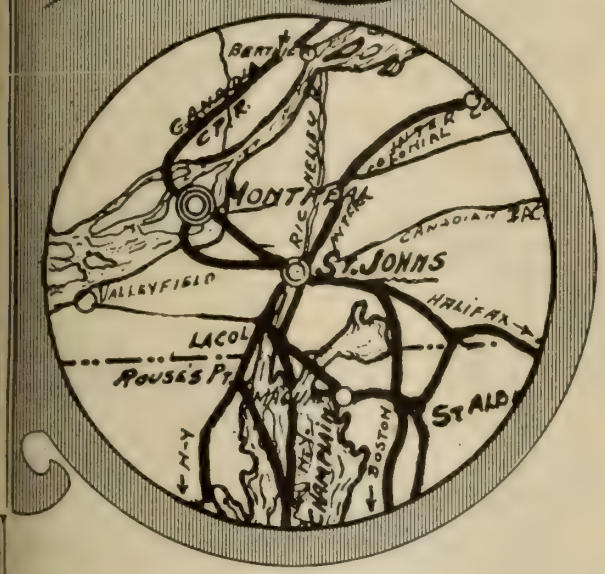
FAST AND ACCURATE—Equipped with set over swivel tailstock and carriage, and outside face plate and tripod. Built in 16" swing with beds 6 or 8 feet in length. Spindle is made of high carbon steel, is hollow and fitted with Morse Taper and runs on self-oiling bronze bearings.

Our catolog gives a full description of this strong and highly efficient machine, also our other quality speed lathes and grinders. Give us your address.

J. G. BLOUNT COMPANY

EVERETT, MASS., U.S.A.

The City of ST. JOHNS, QUEBEC



ITS LOCATION

It is located in the Province of Quebec which, as regards industries, is to Canada what New England is to the United States. (It is 27 miles, or 45 minutes, from Montreal).

ITS RAILWAYS

The two big railroad systems (double track) of Canada, the Canadian Pacific and the Grand Trunk Railways, pass through St. Johns, where merchandise can be shipped and exported anywhere upon the globe with dispatch. These railways are connected by a terminal switching system: charges at exceedingly low rate. All Eastern U.S. railroads are connected with St. Johns.

Direct Connections with Docks at Montreal

Goods can be exported direct by steamers to European, South African, South American and West Indian Ports.

St. Johns has long been recognized as the cheapest labor centre in Canada. Reasonable rents and living costs are keeping it so even in these times.

No other locality offers the following inducements to new industries---but we do

Exemption of taxes for fifteen years' period that is subject to extension. All public improvements which you may require, such as extension of streets, sidewalks, waterworks and sewerage; five per cent. bonus to you on your payroll for five years and if you wish we will advance this to you to be applied to the purchase or erection of any building suitable to your purpose.

For more specific information write to

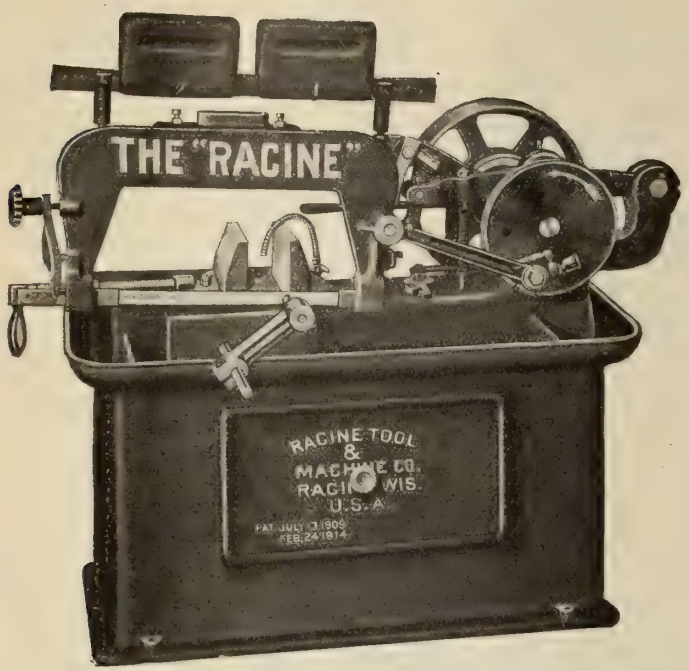
Standard the World Over

"THE RACINE"



HIGH SPEED METAL CUTTING MACHINE

Reduces Blade Expense

Aside from its ability to turn out more work than any other metal cutting machine, "THE RACINE" will save you considerable money on blades alone—enough to pay for itself in a reasonable time. The automatic lifting device is responsible for that. It automatically raises the blade on the return stroke, relieving it of all dragging or strain. This also means quicker cutting, less power used and greater production.

There are many ways "THE RACINE" will prove a big saving. Let us tell them to you.

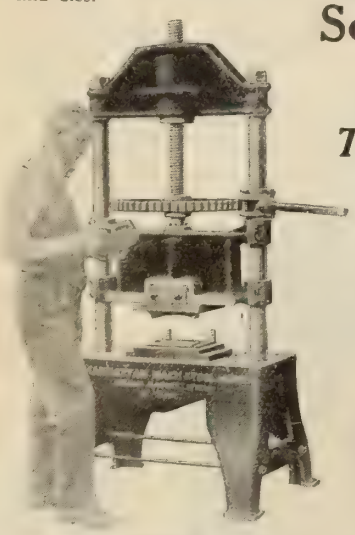
Use "Racine" H.S. Tungsten Power Blades

Racine Tool & Machine Co.
Melbourne Avenue, RACINE, WIS., U.S.A.

Mr. Toolmaker, you need it!

A one-man machine. You require no help in handling any dies.

Insures rapid production of accurately fitting punches and dies.



Type B
Guaranteed to 80,000 lb. pressure.

Manhattan Screw Press

Speeds up Tool Making

It is both sensitive and powerful in operation, having power enough to shear in any die within its capacity.

The convenient handling saves hours of time.

Peerless HIGH SPEED

The Standard Metal Saw of TO-DAY

While labor is demanding more and more, manufacturers are demanding machines of greater output. The "Peerless" meets that demand. It is the standard metal saw of TO-DAY.

With its rapid cut and various time-saving features, it easily increases production from 50 to 100 per cent. With its automatic feed, straight line pull, positive blade clamp and general rigidity, it gets the maximum results of which a blade is capable and reduces breakage to a minimum.

OUR SIX-SPEED GEAR BOX

(not shown in cut) further increases output and saves blades wherever soft steel or metals of varying degrees of hardness have to be cut. The "Peerless" is furnished either with or without this feature, also with or without motor.

A trial order at our risk and expense is convincing

NO QUARRELS

—when Johansson blocks are used

Differences of opinion among tool-makers as to who has the correct measurement never occur in the shop where there is a set of Johansson Gages.

Accuracy isn't a matter of opinion—it is a matter of **FACT.**

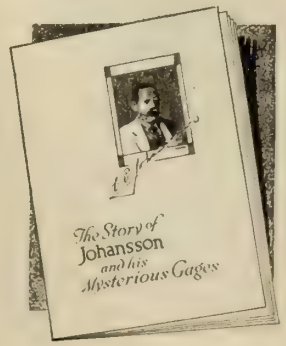
Jigs, fixtures and tools made and checked with Johansson Gages in one shop will pass inspection with Johansson Gages anywhere.

Due to their positive character, any number of mechanics can get the same result when checking a piece of work. For example, the distance between the pins of the jig shown above is the same to all three hands. The combination of Johansson Blocks just goes in.

Three men could check this distance with other types of measuring tools and each might get slightly different "reading." In such a case, who would be right?

No so with the "Johnny Blocks." Their positive, unchanging character gives results that the men are willing to accept.

For this reason Johansson Blocks eliminate scraps, arguments, wrangling, letters back and forth between shops. They get your work accepted and your bills paid.



Write for our booklet, "A Thousand and One Users" and then write to a few of these users. Our oldest customers are our biggest boosters.

"The Story of Johansson" mailed to all who send us their name and address.

WHAT CONDITIONS AFFECT WHEEL SELECTION

A great many times the question is asked, "What wheel should I use for grinding this material to get the best possible results?" Many times it seems that an answer is expected which will be a definite recommendation.

Perhaps a little discussion of some of the many things, which can and do affect wheel action, will make clear just why a definite recommendation **cannot be given.**

Kind of Material.

In general, materials of high tensile strength, such as steel, wrought iron, and annealed malleable iron are successfully ground with Alundum wheels; and Crystolon wheels are best suited to grinding low tensile strength materials of which gray iron, brass and aluminum are typical. Slight changes in tensile strength may make the use of harder or softer wheels necessary.

The higher the tensile strength, the harder it is to tear a chip from the metal. Therefore, the wheel must be kept sharper than for a weaker metal. This is accomplished by furnishing a wheel which is soft enough to allow the abrasive grains to be torn out when they lose their cutting edges, which happens sooner in the case of tough metals. But we cannot say that because a metal has a tensile strength of 100,000 pounds per square inch, a grade K wheel should be used for cylindrical grinding, because there are other factors which must be considered.

Hardness.

Apart from tensile strength, this property has its effect on the choice of wheels (both the grain and grade). Naturally an abrasive grain must penetrate a given material before it removes a chip. The sharper the grain, the easier it penetrates under a given pressure. To cut properly, a wheel face should contain grains which are sharp enough to penetrate easily. The harder the material, the sharper the wheel face must be kept. This makes it necessary to use softer wheels.

But for a given Brinell or Scleroscope hardness, we cannot say a certain grain and grade will be best for the work.

Machine.

Vibration has considerable effect on a grinding wheel. Considerably softer wheels can be used with a heavy machine, set on a solid concrete foundation. This is because there is less pounding of the wheel on the work. Where a machine has light spindles and is attached with spindle bolts to a wooden floor, there may be a large amount of vibration. Because of this, the wheel constantly gets out of truth and besides pounding itself to pieces must be dressed very frequently.

One can easily understand that vibration cannot be measured numerically in given terms from which we can determine the proper wheel to use.

Finish.

By a good commercial finish one operator may mean a fairly rough surface, whereas another may have reference to a highly refined grinding job. You can well realize that it is impossible to say, "We want to get finish No. 3. Give us a wheel for this work." You may say, "We must have a very good surface. We recommend trying a 46 grade K with which some operators can get excellent results and good production." Because another operator tries to remove too much stock during one traverse or does not dress the wheel fine enough, we may have to furnish a 60 grade K or perhaps even an 80-J.

With the wide experience of the Sales Engineering Department in furnishing wheels it is possible to specify one which will be very near the proper grain and grade, but the most efficient wheel can only be chosen by actual tests under regular production conditions in the plant where it is to be used.

Vol. XXII. No. 25 December 18, 1919

Various Types of Cold Chisels and Their Uses*

Planing, Shaping, Milling and Other Machine Operations Have Decreased the Chisel's Field of Usefulness. There Remains, However, a Place for the Humble Chisel as This Article Will Show

NEXT to the file, the cold or chipping-chisel is the most useful tool employed for the cutting of metal where hand work is necessary. In the early days, when planning and shaping machines were scarcely developed, this tool held prime place as a roughing appliance, preparatory to finishing with the file. All this laborious work has been abolished by the introduction of planing, shaping, milling, grinding, and keyway cutting machines, and such regular operations are only performed by hand when it is impossible to use the machines, as on breakdown jobs, emergencies, situations where the work cannot be removed conveniently to take to the machines, and out-door jobs. But, apart from such cases, the chisel fills a large place still at the bench, and in power-plants, on railway and tramway jobs, gas, water and pipe undertakings generally, being adapted for cutting various shapes of surfaces, removing superfluous pieces of metal, cutting grooves, slots, holes, and parting off wire, rods, bars, pipes, sheets, corrugated iron, girders, etc. With the introduction of pneumatic hammers the chisel has had its capacities immensely increased, particularly for girder and bridge work and shipbuilding, in which tough steel has to be cut.

A glance at the principal types of chisels in common use may be first taken, as there are a good many differing varieties of work which require a particular shape of chisel to cope with them. For ordinary chipping of surfaces, cutting off lumps, serving lengths of material, and general cutting, the common chisel, A, Fig. 1, is employed, having an edge exceeding the width of the stem portion; the latter is sometimes made much longer for reaching into places where the ordinary length will not go, and to give leverage for forcing and prising purposes, as when necessary on some breaking up and repair work. In some cases where the width of edge of this ordinary chisel prevents it being used, the "cape" chisel has to be employed; this is narrow, and thickened up for strength in the vertical direction, B. There is a modification of it utilized for key-seating purposes, C. that is cutting key-grooves, etc., where the one-sided formation is more convenient for manipulation, and it is easier to see the edge. The diamond point and the round-nose chisels, D and E, are selected chiefly for making grooves, such as those for draining purposes, or for leading in oil, and for serving pipes and other shapes by nicking round. Oil-groove chisels, F, are round-nose, but bent to enable them to be used in the concavities of bearings, brasses and pulleys. For heavy duty round-nose cape chisels, G, afford a stronger shape. At H is illustrated a round-nose with larger curve, suited for cutting concavities less pronounced than oil-grooves, as well as for cutting out circles in sheet metal, a further development for this function being the cow-mouth type, J. Another modification, seen at K, is shaped for severing corrugated iron, the edge being ground to a quick curve, while a hollow-ground edge, L, is sometimes used for pipe-cutting, being much less likely to slip when working round the circle.

The section of steel chosen for a chisel of standard size is usually octagon, because this gives a firm grip with the minimum tendency to twist during the hammering, combined with

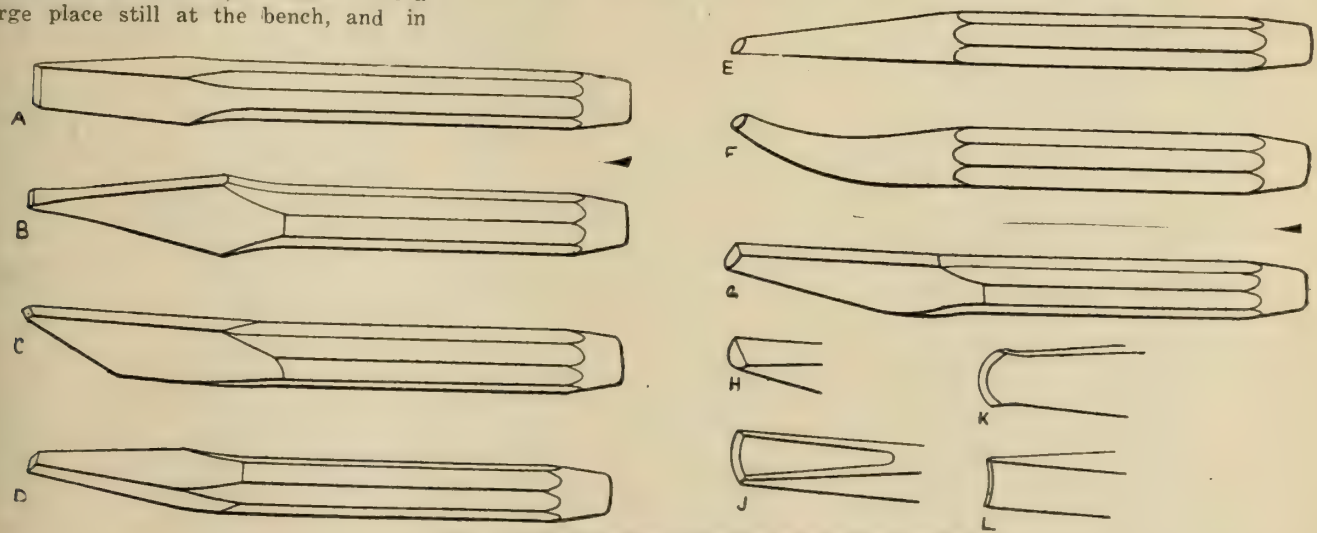

FIG. 1—ILLUSTRATING VARIOUS STYLES OF CHISELS.

*From the "Tardware Trade Journal."

the least fatigue to the hand. Another section largely utilized is round, with flats on opposite sides, giving a comfortable grip. But in the smaller chisels for fine work, where the hold is generally between thumb and fingers, a round section, plain or knurled, is suitable, and square section is also convenient, being a little less trouble than round to keep from twisting.

One of the troubles incidental to chipping is that of obtaining the correct temper of the chisel edge. If too soft for the purpose the edge soon goes, preventing neat work, and adding to the labor; if too hard the edge is likely to shiver to pieces, or break out piecemeal. The results, however, depend upon the material under treatment, the severity of the blows, and the skill of the craftsman. A very hard chisel may successfully endure on light duty, that is, penetrating soft materials, taking light cuts, and struck skilfully with fairly directed blows; while on hard stuff, or if sent too deeply in, or struck awry, the edge may go to pieces immediately. The advantage of using a hard chisel is that its edge lasts keen so long, and much better work may be therefore done, with less waste of time and of steel incurred through sharpening. The method of tempering a chisel is to heat the nose up for a length of two inches or so to a bright red, and quench in water for a few moments, leaving the stem still hot. The chisel is then withdrawn from the water, the end rubbed bright with a bit of broken grindstone or emery wheel to obtain a small patch on which to watch the color. This begins to creep along, due to the spread of the heat in the body, and the tool is completely quenched when the appropriate shade of straw color shows. The pale straw is suitable for average service, and a darker shade should be chosen for the severest duties, where the hardness or toughness of the material opposes great resistance to penetration.

The edge of a chipping chisel, like other cutting tools, is nothing more than a wedge, and the keener it is ground the more easy will penetration be. But the limitation of strength comes in, and too keen an edge will either dull, turn over, or shiver to pieces. The included cutting angle is therefore made from 45 deg. to 60 deg., and re-sharpening (as well as easy cutting) is facilitated by forging the end thin, Fig. 2, A, leaving short grinding facets, and freedom for the cuttings to slide up into the air. The angle at which the chisel is held, B, is approximately 45 deg., varying according to the cut, the ground angle of the cutting edge, and the quality of the material. On soft stuff, where penetration is easy, the chisel may lay lower down and be driven along with facility, while in hard metals, which break off in short bits, the chisel must be tipped more towards the vertical, particularly when starting a cut afresh. The edge should always be pushed up to the cut before rather than near the nose, the latter position being liable to let the head wobble about. There is no advantage in having a large area of head surface (with a mistaken idea of lessening the chances of misses) because such an expanse causes difficulty in getting on a fair direct blow. The top should be ground round to a neat chamber, and trimmed as often as rags are beaten out by the hammering. To leave these ragged overhanging edges on is rather dangerous, because a chance unlucky blow at one side might drive the fringe off and down into the worker's hand. The edge of a chisel when required for going over a flat surface, or for severing purposes, ought not to be ground straight across, but with a little convexity, Fig. 2, C; the idea of this is to render guidance easier, from the fact that the corners do not pull into the metal and tend to draw the chisel out of its path, and moreover, they are not so likely to be broken off by concussion. When one desires to chip a very flat, true surface, especially at a finishing cut, the degree of convexity ground on the edge should be very slight indeed, so as to prevent chipping a series of hollows.

The removal of a considerable quantity of metal from a face is not best accomplished by employing the ordinary wide chisel, as this takes a lot of heavy slogging, and the width of the chips (in fibrous materials especially) renders their bending up a laborious task at each blow. The use of the narrower cape chisels is better, running a series of grooves across, after which the chipping down of the ridges thereby produced is easy—see section D. This also shows chamfering of the edges before commencing to chip, the depth of chamfer corresponding to the depth of the material to be removed. The chamfer all round serves two purposes: (1) to act as a guide to the eye without scrutinizing a scribed line frequently; (2) to prevent the breaking out of the edges when the chisel works towards an edge. After a face has been fairly reduced, its flatness can be assisted by frequently changing the attitude of the chisel, setting it diagonally to the last series of cuts so as to top off the ridges and avoid the formation and perpetuation of hollows, this being done by changing one's foothold on the floor, shifting around the vice or the work.

Chipping interior surfaces is sometimes awkward on account of the difficulty of seeing the results, and the narrowness of apertures. Occasionally it becomes necessary to grind a chisel similarly to one for wood—i.e., with facet on one side only, E—in order to be able to lower the tool enough to pass through the hole or slot.

This often arises in producing square or rectangular or other apertures from solid metal, subsequently to drilling out

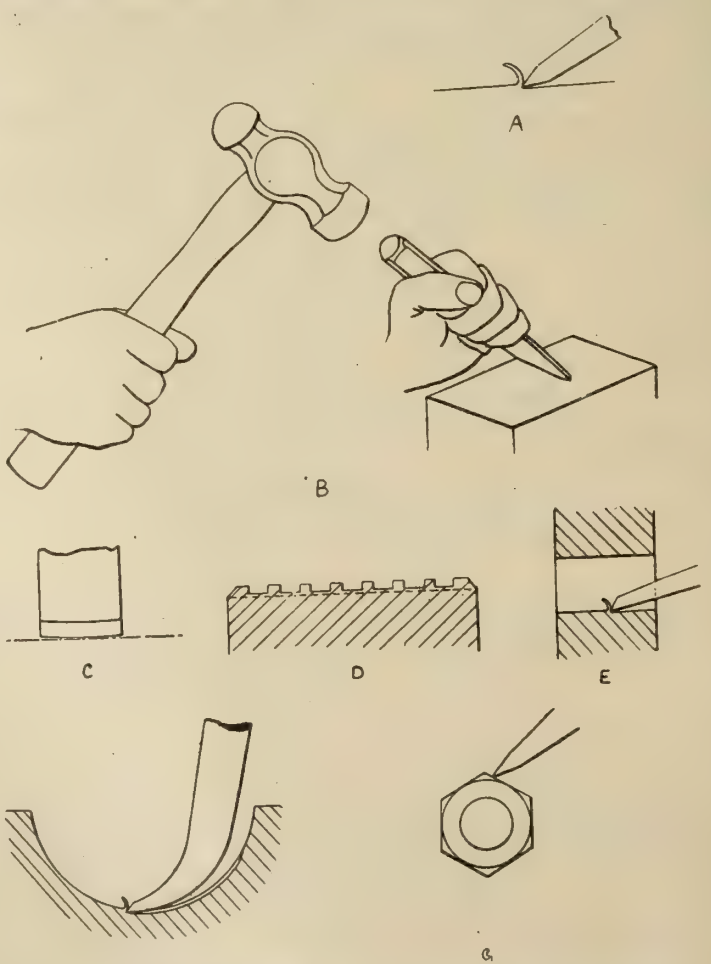

FIG. 2—ILLUSTRATING USES OF THE VARIOUS STYLE CHISELS.

the bulk of the stuff. The round-nose chisel, if used for chipping oil-grooves in bores, takes up a similar attitude, but in cutting around a curve, as when oil-grooves are disposed spirally, a straight-backed cannot be used without digging in too deeply, hence the back is curved for this operation, F. The groove is chipped by judging the direction with the eye, or a line is marked by laying a strip of thin card or zinc around the curve and scribing a line along, guiding the scriber by the edge of the strip. If the chipping is performed neatly, very little filing will be required to make a smooth finish. The end of a rat-tail file will have to be bent to enable this to be done, heating the file for a distance of about ¾ inch to a red, and knocking it round the edge of a block of wood, afterwards re-heating to bright red and quenching.

Apart from legitimate chipping, the cold chisel is handy for odd jobs, such as forcing open joints that have rusted up, knocking off scale and rust, cutting off rivet and bolt heads, and loosening rusted nuts. The last-named job is done by striking against a corner of the nut, G, the jarring effect being very useful in starting to loosen. The chisel edge should not be sharp for this purpose, or it will simply chip the corner off without producing the desired result. Sometimes a special chisel is kept for these emergencies, having its edge ground off blunt, and occasionally a hard brass or gunmetal one is used for loosening bright nuts that ought not to be spoiled.

Canadian Machinery Drafting Course—Part IX

A Further Discussion on the Art of Projection. Students Should Study This Portion Slowly, Making Sure They Grasp the Underlying Fundamental Principles

By J. H. MOORE, Associate Editor Canadian Machinery

SO far in this course we have taken up two plates in projection, but not any examples of what would happen in the event of a cone or cylinder being intersected by a plane.

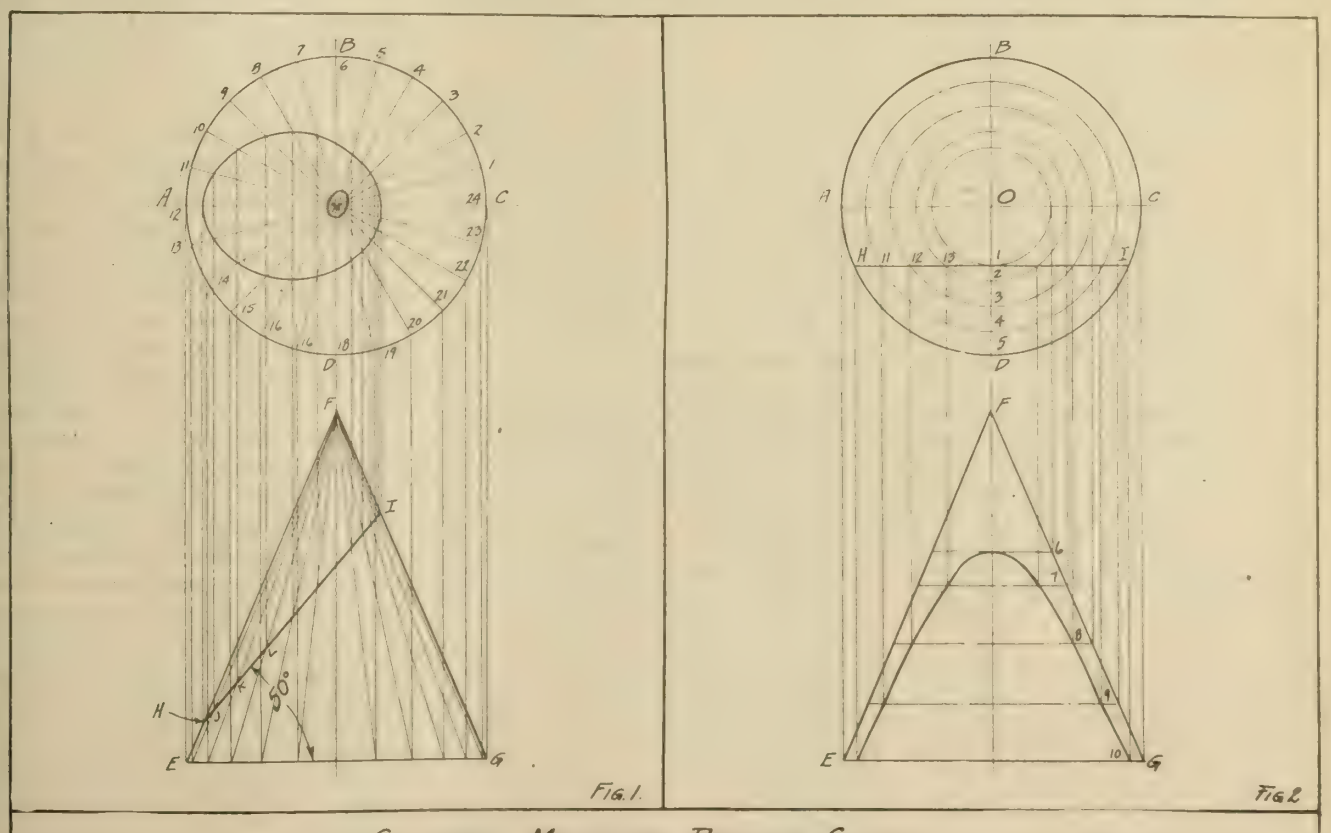
In this section we will discuss just the point spoken of above, and discover what occurs when a plane and cone meet.

Different curves are formed when such occurs, and two illustrations in the shape of Figs. 1 and 2, from plate No. 9.

If the plane of intersection is perpendicular to the axes of the cone, or cylinder, the curve of the intersection will be a circle, but if it is inclined to the axis it will be an ellipse in case of a cylinder, and an ellipse, hyperbola, or parabola, in the case of a cone, all depending on the angle of inclination.

Fig. 1 illustrates a cone cut by a plane, which, although cutting the cone, does not intersect the base of the cone. When the cutting plane does not intersect the base of the cone, the curve of intersection will be a true ellipse. Had the plane cut through the base the curve would have been a parabola.

To construct Fig. 1, proceed as follows: First, draw the plan view of cone base, by means of the circle, A, B, C, D; make this 3 in. diameter; divide this circle into 24 equal parts, as shown; from each point of intersection project down vertical lines until they meet at the base of the cone, E G, in the other view; this line can be placed to suit your own convenience. Make the distance vertically from this base to the point, or apex F 3½ in.; let the intersecting line, H I, start anywhere about where is shown on the plate, and let it form an



WATCH THIS PLATE. TAKE TIME TO DO IT NEATLY. ABOVE ALL SEND US IN YOUR WORK.

angle of 50 degrees with the horizontal.

From each of the intersecting points on the base of cone draw lines directly up to the apex F. Where these lines intersect with the plane line, H I, erect perpendicular projection lines up into the plan view. These lines are produced until they meet with the various radial lines on the plan view, such as 0, 11, 0, 10, and so on. The intersecting points in these lines form the contour of the ellipse to be drawn. Readers will, no doubt, have followed this description closely, and will now be able to proceed to draw this figure in place. Above all, study the work before drawing, for it is important that not only the principle be understood, but that care be taken. Without the proper care, the figure is useless, for it will not be a true projection.

In laying out these figures previous to inking in, be sure you do not use a softer pencil than 4H. If you use a 4H be sure the point is good and sharp, for blurry lines will be a great drawback to you in this work, and especially on this plate.

If students will only play safe, go easy, and keep their wits about them, this plate should not cause exceptional trouble.

Fig. 2. We now come to an entirely different proposition, namely, that the vertical plane, H I, is parallel to the axis of the cone. In this instance the curve, when found, will appear in its true shape and size, as the plane H I is parallel to the vertical. Students will note the method of solution.

The first step is to, of course, draw the cone, plan, and elevation views as before. The same sizes exist in this figure as the last.

Draw the line H I any place to suit, say, approximately, 5-8 in. away from the centre line, as shown. Now construct a circle tangent to this line, as illustrated at 1. Between the space 1 and D divide the distance up as you see fit. In this case the writer has shown 5 divisions, although he could equally as well have shown 12, or more, for the greater the number of divisions the more accurate the curve, but for the principle of the idea, the writer thought 5 sufficient.

From these circles on the centre line, A C, project down lines meeting with the elevation view of cone. Construct horizontal lines from these points as shown. It will be noted that a projection from the circle 0 1, lands the line down to the point 6, this point being in turn projected horizontally to locate the top of the curve, which in this case is a hyperbola.

From the points H, 11, 12, 13, etc., to I, vertical lines are projected down, these intersecting at points 7, 8, 9, 10, and, of course, in similar manner on the other side of the curve. By joining these various points found we construct our curve as shown.

For students' benefit and reference let us consider what we have found:

We have come to the knowledge that when a cone is cut by a plane which does not intersect the base, we construct as the curve of intersection, an ellipse. (Note, a true ellipse, and not an egg-shaped oval).

That in the event of the cutting plane passing through the base of the cone, we construct as the intersecting curve a parabola.

That when the cutting plane is parallel to the axis of the cone and perpendicular to the vertical plane, we secure as the curve of intersection a hyperbola.

There is one other point could be spoken of, namely, that in the case of a cylinder, which has a cutting plane running through its length at an angle, the resultant curve will be an ellipse.

Students cannot do better than memorize these points, as they come in handy when we get on further in the course.

So now to work on Plate No. 9. Stick to it, make sure you are accurate in your projections, dimensions, etc., and exercise great care when inking in. Above all, let us see your work for inspection. If you haven't so far landed a prize, there is no time like the present

A NEW RIVET FORGE

A rivet heating forge of a new type, the invention of an employee of the Pacific Coast Shipbuilding Company, is described in "Full Speed Ahead," the paper published at the plant of the company on Suisun Bay, thirty-five miles east of San Francisco. The account says:

An improved oil forge for heating rivets has been devised by J. T. Shepherd, plant plumber. Several of the forges are already at work. One of their most commendable features is the avoidance of backfire. Higher vaporization of the oil is secured through the use of the new invention.

The main features are a valve on the air line and a needle valve on the oil supply, with a mixing chamber. The latter is formed of a 1¼-inch T with a 1¼-inch nipple and a bell reducer reducing to ⅜. Above this is a second mixing chamber, formed of a 1-inch ell, the oil being carried then through a ½-inch T with a ⅜-inch nipple, forming an injector. Free oxygen is taken in with the vapor.

There is a ¼-inch vent on the tank, to make filling quicker, the vent forming a suction on the funnel. It is not necessary for the boy to go to the manifold to turn the air off. This is done right at the furnace. Another advantage is that the new forge needs no labor to connect the hose. A male hose connection is used, obviating two couplings.

The piping on the end where the valves are controlled is protected with a stay plate, reducing the danger of damage to the forge. The danger of backfire is eliminated by fire clay sealing.

The forges are also equipped with bleed valves, making it possible to clean out the tanks easily. Not only can water be bled from the oil, but the bottom of the tank can be blown clean.

Shepherd, who has been working on the forge design for some time, gave it to the company as a contribution to the yard's productivity.

COAXING WINDMILLS IN DENMARK

During the coal famine caused by the war many attempts were made, especially in Denmark, to improve the working of the windmills geared to dynamos to generate electricity. About 250 installations on farms and small estates have proved fairly satisfactory. Many experiments in this connection were carried out by the late Mr. P. la Cour, and a trial mill designed by him is still being used for observation purposes. During about one-third of the year there was either complete absence or excess of wind, and the force available was very variable. It was nevertheless found possible to save fuel for steam or gas-driven power producers. The cost per kilowatt from peat gas-fired plants is approximately the same as from a windmill-driven installation. Attempts were made to design special three-phase dynamos capable of maintaining constant voltage independent of the speed of the mill, special attention being also paid to automatic adjustment of the sails in order to reduce the cost of attendance.

What About Elevator Hazards and the Public?

The Elevator Has Dangerous Possibilities in Spite of Its Excellent Service. The Following Paper Read Before the Annual Congress of the National Safety Council Gives a Resume of Elevator Hazards

By DANA WEBSTER, Aetna Life Insurance Co., Indianapolis

BEFORE making any remarks on the safety of elevators, it might be interesting to cover, briefly, the gradual development in the manufacture of mechanical lifting devices.

Mechanical Lifting Devices

Lifting devices were undoubtedly used by Julius Caesar as far back as 256 B.C., as history mentions their lifting animals from the dens to the arena in the Coliseum of Rome. About the middle of the Nineteenth Century, platforms or cable-hoisted elevators were first installed in New York and Boston, but were not provided with any kind of safety devices, and, strange to say, you can find a few elevators without safety devices at the present time.

A few years later elevators were equipped with safety devices of such type that it was necessary for the hoist cable to break before the safety could actuate. There are a great many of this type of safety in use to-day, but with the introduction of high-speed elevators, which were required to meet the demands of the public, quite naturally it necessitated much better type of safety apparatus and a multiplicity of cables.

Accidents could, and did occur, from over-speeding elevators, caused by disarrangements of the controlling apparatus, and it became necessary to provide safety devices that would actuate should the elevator speed increase beyond a predetermined number of feet per minute.

The most essential elements of safety are the prevention of excessive speed from any cause, the over-running of the limits of travel at top and bottom, safe protection at the landing entrances to the elevator, and a regular examination of the cables and all parts of the elevator equipments.

Car Safety Device

The early type of the safety device was designed to stop the car instantaneously. They served the purpose satisfactorily for slow speed, but were not adequate for the higher speed of 400 to 700 feet per minute. It, therefore, became necessary to provide a safety device that would stop the car with an easy and gradual stop. This is accomplished by the friction clamp safety, which is actuated by a safety speed governor, usually set to trip at 40 per cent. above regular speed. This governor will act should the hoist cable break, allowing the car to drop, or should the car over-speed from some defect in the machinery after the governor trips and the car has dropped far enough to take up the clearance of the safety jaws. The jaws are forced hard against the guide rail (like a vice), and the car will continue to slide until the friction is enough to stop the car entirely. The distance the car will slide after the safety takes hold, depends upon the load; but the farther the car slides the tighter the safety grips the rail. Usually, a car will drop about six feet after the governor trips and clamps the governor cable.

Over-running of Limit Stop

The machine of all power-operated elevators should be equipped with automatic limit stops; that is, a device that will stop the elevator at the top and bottom limit of travel, regardless of the operator.

On Drum machines, the Automatic Limit Stop should be built with and made a part of the machine.

On Hydraulic elevators, the Automatic Limit Stop should consist of a Cut-off Valve, either in the to-and-from pipe, or in both the supply and discharge pipe.

On Traction type of elevators, the Automatic Limit Stops must be located in the hoistway, and the power cut off by the travel of the car. As there is more or less slippage of the hoist cables on the drive sheave, a machine automatic would not be dependable. In addition to automatic limit stops on electric elevators, there are hoistway limit switches located so that, should the car travel a certain distance by the automatic limit stop, the car would open a switch, thus cutting off the power and stopping the machine.

Safe Protection at Landings

The early types of passenger elevators —and, in fact, most elevators up to the present time—are provided with landing doors equipped with a catch located on the inside, so that the door can only be opened by the operator. The operator, however, in order to make speed—and the public is partly to blame for this—starts the elevator before the door is closed, and quite often the door would not fully close and latch, thus providing a very dangerous condition. Many persons have opened the door when finding it ajar, and, looking in the hoistway, have either fallen or have been knocked down the hoistway by the car and severely injured or killed. I might say, right here, that statistics show that 85 to 90 per cent. of all elevator accidents occur at the landing doors. Therefore, it became necessary to provide the landing doors with a locking device that would prevent the doors from being opened, unless the car was at the landing; also to prevent the car from being removed away from the landing until the landing doors were closed. This is termed the Interlocking Device, or Interlocks for Landing Doors. While I believe all landing doors of passenger elevators and gates for freight elevators should be equipped with interlocks, I am sorry to say that, at the present time, only a small percentage of elevators are equipped with this device, although they are becoming more and more in general use.

Cables

The Cables are the most essential parts of the elevator equipment, and their number and size should be equal to the load with a good factor of safety. The sheave should be of ample size, and placed in alignment, to prevent chaffing of the cables on the sides.

Great credit must be given to the manufacturers for the high state of perfection these devices have brought. This fact must be admitted when considering the few accidents on elevators, compared to the large number of passengers carried. Statistics show that 10,000,000 passengers are carried in the Borough of Manhattan daily, and it is said that this number exceeds the number of passengers that ride on all the surface, elevated, and subway cars; in other words—more people ride vertically than horizontally.

A great many elevator accidents are not due to faulty design in construction, machinery, or safety device, but to the carelessness of the injured party. It, therefore, becomes necessary for the City or State to enact Ordinances and Laws regulating the construction of elevators, and enforcing their equipment with effective safety devices, in the interest of accident prevention; that is to say—to prevent a person from being injured by his own carelessness, and also by the carelessness of the operator.

Elevator Inspection

Are the Safety Devices Kept in Proper Condition? is one important question. The only way this can be accomplished is by having the elevator regularly inspected by a competent elevator inspector, who should inspect all the different safety devices, machinery, cables, etc., in fact, everything pertaining to the elevator. The landing doors should be tried to determine whether they can be opened from the outside. The car safety device should be tested to be sure that it would actuate

and hold the car from falling, should the cable break. The automatic limit stops should be tested so as to be sure the car will not over-run and strike the overhead beams or bumpers. The slack cable device should be tested to be positive the power would be cut off should the cables slacken. The brake should be examined to be sure there is no slippage. The cables should be examined very carefully for defects, as there is no part of an elevator that requires the exercise of more good judgment than the examination of the cables. It is just as essential that the safety devices, and all parts of the elevator, be kept in good working order, as it is that they should be installed in the first place. After an inspection has been made, the owner should proceed immediately to install safeguards and remedy any defects reported.

The elevator should be oiled and greased regularly by the engineer, and looked over carefully for any defects, and not wait for an inspector to make a thorough inspection, and oftentimes the engineer will discover some little defect which, if fixed immediately, may avoid a serious accident.

There is another feature that I wish to mention before closing; that is, the elimination of mirrors, in fact all glass, from the passenger cars (except the electric light bulbs), not only because of the fact that they are liable to cause injury to passengers by getting broken, but also because of their attraction, which results in passengers failing to notify the operator promptly as to their destination. This necessitates a stop between floors, and a trip back to let them off. They also have a tendency to retard the loading and unloading of the cars.

What Plan Do You Adopt in Estimating Costs?

Do You Calculate the Total Weight of the Machine, or Apparatus, Then Guess at a Price Per Pound, or Do You Attack the Problem in a Systematic Manner?

By JOHN S. WATTS

THE usual method followed in making up an estimate for quoting on an inquiry is to calculate the total weight of the machine or apparatus in question, and then guess at a price per pound, taking as a basis the cost per pound of the most similar piece of work done previously.

While this method, if good judgment is used, will give fairly accurate results, if the job being estimated on is similar in every respect to the one taken as the base for the pound price, it is very seldom that this condition is fulfilled.

As a general thing in the small shop, the work to be quoted on consists of special machinery to the customer's drawings, and in taking the cost per pound of a certain type of machine made to one firm's design as a criterion on which to base the price per pound of a similar type of machine to another company's drawing, we are likely to be led astray, becuase one design will most likely have more weight of material for a given amount of machine work than the other, the two machines having been designed by different men, with different ideas, and to work under different conditions.

Another common method is to calculate from the drawings the cost of the raw material, i.e., plates, shapes, castings, etc., entering into its manufacture, and then submit the drawings to the foreman in each department for his estimate of the labor cost in his department

This is, outside of the estimated cost of the raw material, nothing but a guess. Very few, if any foremen have sufficient data on which to make an intelligent estimate. For instance, a foreman, especially in the small shop, has no time to spare for this work, nor should he be expected to attempt it, as by so doing he is compelled to neglect his proper function.

Estimating Costs in the Small Shop

The foreman will usually glance over the drawings and make some kind of a mental estimate (a euphemism for guess) as to about how many days' work will finish the job, and put in his estimate accordingly, with every intention of living up to the estimate, if not in actual fact, then at any rate by making the time sheets to agree with the estimate, soaking the balance on to some job that is not estimated on. This procedure makes some jobs so expensive that the customer kicks, and the costs of the job estimated on, as shown by the books, are below the actual cost, and are misleading and apt to lead the shop into losing money on future work through taking the cost of this job as a basis for quotations on similar work.

The system used by the writer for some years with gratifying results, is based on the fact that for similar operations on similar parts, the time consumed in doing the work will be proportional to the area to be machined.

To start with, whoever is going to do the estimating should split up the operations on each piece into boring, planing, turning, etc., and calculate the area in square inches for each operation of the surface to be machined.

Until data have been accumulated from actual work performed the area that can be machined by the various processes per hour will have to be estimated, but when the work estimated on has been done, the actual time can be used and the estimating changed from guess-work to a simple arithmetical problem, taking only a few minutes to solve.

In the case of boring, drilling, or turning, it is easier and just as accurate to take, instead of the area, the diameter of the piece or hole and multiply by the length of the machined surface, as both quantities are in direct proportion to each other.

To have these figures easily accessible, a card index should be used, the information being written directly on the cards about as follows:

Estimating Costs in the Small Shop

The heading of the card signifies that it is for data on boring straight holes in iron castings, that is parallel holes without keyseat, and the hub faces left rough. The first column gives a general idea of the part in question, and is neces-

Boring Straight Hole in C.I.

Part	Dwg. No.	Mach'n'd Surface	Area or DXL	Hours	Area or DXL per Hour
Rope Sheave—16" diam.	1125-B	2¼" Bore—3½" Long	7.875	$\frac{80\frac{1}{2}}{50} = 1.61$	4.9

ONE STYLE OF CARD USED.

sary to have, as it would take longer to bore the same size hole in an awkward shaped casting that had to be clamped to a face-plate. If conditions warranted it, another card could be appropriated for this latter class.

The second column gives the drawing number in case it might be necessary to refer to it for comparison with other work to be quoted on.

The third column gives the dimensions of the machined surface so that in estimating other jobs we can pick out for our basis the nearest size we have data on the card. It being understood that while only one job is shown on the sample card above, in practice other jobs of the same class would be entered on the card as data was gathered in time.

BORING STRAIGHT HOLE IN CAST IRON

PART	DWG. No.	MACH'D SURFACE	AREA OR D x L	HOURS	AREA OR D x L PER HOUR
Rope Sheave 16'0	1125-B	2½" Bore - 3½ Long	7.875	$\frac{80\frac{1}{2}}{50} = 1.61$	4.9

ILLUSTRATING THE FIRST CARD DESCRIBED.

The fourth column gives the area of the machined surface, or in the case of boring, etc., the diameter multiplied by the length, as explained above.

The fifth column, which is not filled in until completion of the work, gives the hours per part. In the example the figures $\frac{80\frac{1}{2}}{50}$ mean that 80½ hours were consumed in boring 50 sheaves, giving 1.61 hours as the time for one sheave. This 1.61, divided into the figure 7.875 in the fourth column, gives us the figure 4.9 in the last column.

It should be understood that the time taken includes all the time charged against the job, that is setting up machine, trueing up in lathe, etc., and the time of any helpers that may have been necessary.

Now, if we are called upon to estimate the labor cost of boring some 24 in. rope sheaves with a 3 in. hole, 4 in. long, the formula is:

$$\frac{D \times L}{4.9} = \text{hours}$$

$$\frac{3 \times 4}{4.9} = 2.45 \text{ hours}$$

From the card, we note that the 4.9 was taken on an order of 50 sheaves, so if the number of 24 in. sheaves to be bored is larger or smaller than 50, we would decrease or increase the 2.45 hours in accordance.

By putting this system into effect in the course of time we will accumulate a set of cards covering all the usual operations of our shop, and which will give some approximate idea even for the unusual operations.

The amount of clerical work involved is not great, and, in fact will soon, by eliminating guesswork and the running around to interview the foremen, save time.

Also, it will cut the losses incurred by underestimating, and also help to avoid losing work by overestimating.

It is not possible, nor would it serve any useful purpose, to try and get every job that went through the shop on these cards. The aim should be to get a line on all the various kinds of operations going through the shop. Some operations such as boring and keyseating can be lumped together on the one card as though they were only one operation.

WHY IS WELDING PROFITABLE?

Continued from page 603

in fact, for more things than there is time to mention herein. In connection with the cutting torch, the welding plant is useful for shearing and punching, chaping and straightening, cutting and splitting, in places inaccessible to any other method. The process may be utilized for removing carbon from tractor, auto and truck engine cylinders. In fact, it is hard to see where the objectors base their claim that the welding plant is liable to stand idle part of the time, unless they mean they would not get out and hunt up the business. There is plenty of work for the welder in the country right now; what will it be when things get going good?

And while we are on the subject of possibilities let us not forget the airplane. Here is something that is more than a possibility. The time is at hand when we will be using the air for means of transportation and pleasure to an extent little dreamed a year or so back. Already it is a common sight to see an air craft sailing over any section of the country. With Federal backing it will advance rapidly from now on. And this means opportunities for the torch operator. Many parts of the airplane absolutely demand wedded joints both as a factor of safety and to cheapen the machine. The principal cities over the country are planning landing grounds and otherwise preparing for the advent of the airplane. The welder should be on hand to make the repairs when needed.

As a closing argument let us review a list of people who need the welding machines. Who not only use them but must have them if they hope to cope with competition on all sides: First the repair man who can not get along without a plant. Then the foundryman, in steel, brass and iron; the junk dealer; the garage owner; the blacksmith; the miner; the contractor; the railroad; the electric power company; the shipbuilder and general manufacturer. Perhaps many more could be named but this list should remove any doubts as to the usefulness of the modern welding plant.

Yes, it is perfectly safe to purchase the welding plant you have been thinking of. Cut in now and get in on the beginning of things. It is a good idea to add to your present equipment if you already own a good plant. If it is an old-fashioned outfit you should investigate the advantages of a more modern machine. Don't get the idea that there will not be work enough to go around. And don't think the method is not a success. Also don't think you cannot learn to operate a welder as well as the other fellow. It is only a matter of sticking to it.

PRODUCTION OF ASBESTOS INCREASING

The asbestos industry of the United States is in better condition now than ever before, especially as to the quantity and the grade produced, and the outlook is encouraging. Most of the asbestos used in the large asbestos factories of the United States comes from Canada, but the growing appreciation of the high quality American fiber, especially that from Arizona, is a welcome feature of the industry.

The total quantity of domestic asbestos sold in 1917, according to J. S. Diller, of the United States Geological Survey, Department of the Interior, was 1,683 short tons, valued at $506,056, an increase of about 13 per cent. in both quantity and value over 1916. Most of the domestic asbestos comes from Arizona, where the proportion of crude spinning fiber to that of lower grades is much larger than in Canada, so that the average price of American fiber in 1917 was $301 a ton, whereas the average price of that in Canada was only about $50.

Some years ago the opinion was expressed that as the Arizon fiber contains less iron than that mined in Canada, it is therefore better adapted to use for electrical insulation than the Canadian fiber. This opinion has lately been confirmed by analyses made by R. E. Zimmerman, of Pittsburgh, whose investigations also indicate that the harshness of certain parts of the Arizona asbestos is due to thin films of calcite among the fibers.

A small amount of spinning fiber was mined in Fremont County, Wyoming, from a contact deposit of remarkable interest.

The increased demands for asbestos due to the war have been met largely by increased imports from Canada. The imports of asbestos from South Africa and Italy have been largely cut off. The demand for imported asbestos for use in filters is being supplied by amphibole asbestos obtained from residual deposits of the crystalline rocks of Maryland.

A New Type of Water-Cooled Induction Furnace

This Style Furnace Can be Used to Advantage in the Making of Carbon-Free Melts. This Furnace Was Developed at Trenton, N.J.

By FRANK C. PERKINS

THE accompanying drawing, Fig. 1, and illustration, Fig. 2, show the design and construction of a new water-cooled high frequency induction furnace, developed at Trenton, N.J. There has been constructed a source of high frequency current of 10,000 cycles per second, which is utilized in power units up to one hundred kilowatts. The oscillatory current system forms the major portion of the high frequency induction furnace.

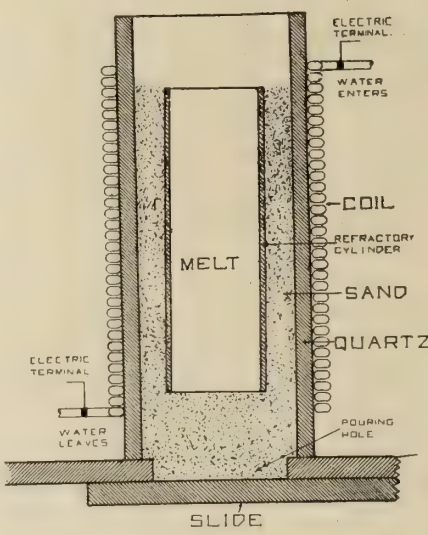
This special type of induction furnace is of advantage in the making of carbon free melts. The diagram, Fig. 1, is almost self-explanatory. The tremendous concentration of energy produced by inductive action in a comparatively small volume, makes it necessary to maintain the inductor coil cool by artificial means.

In order to accomplish this cooling in a simple and effective manner, the material used for winding the inductor coil is a thin-walled, flattened copper tubing. It is flattened and wound edgewise to obtain the maximum possible number of turns to the inch. A small flow of water through this tubular coil maintains it always at the temperature of the tap water used.

The melt, which is located within the inductor coil and which may be only ½ to 1 inch less in diameter than the inside diameter of the coil, may be raised to a temperature of 2500 deg. or 2800 deg. C., the coil remaining under 20 deg. C. The procedure in making a melt of any electrically conducting material such as electrolytic iron or nickel with which other metals are to be alloyed, is as follows:

There is a thin-walled crucible or open cylinder of fire-clay, magnesia, zirconia, or like material formed and this is located centrally in the inductor coil and the space outside and under this cylinder is filled in with fine alumina, silica, or zirconia sand. The metal or component parts of the alloy to be produced is gotten into the form of small pieces, preferably about the size of walnuts, and packed in the thin walled cylinder. When the high frequency current is passed through the inductor coil rapid heating begins at once. This heating is due solely to the enormously large eddy currents which flow in the small conducting masses of the product being heated.

It is of interest to note that the melting of pure iron in lots of 2 to 5 lbs. begins in from 10 to 20 minutes and high superheat is reached in 25 minutes. When the mass has become completely molten, more material may be dropped in. The melted mass does not leak, even though the thin-walled container cracks and breaks, for this is embedded in a mass of sand which makes a natural metal-tight pocket. As soon as the mass becomes molten a very useful and interesting phenomenon is noted.



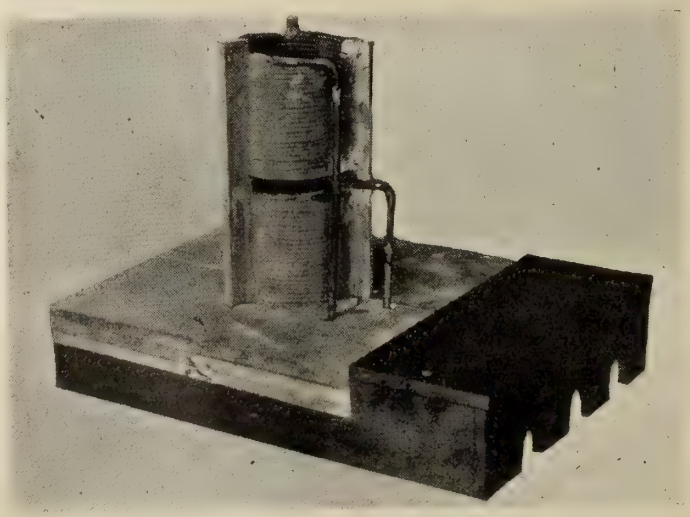
SECTION THROUGH FURNACE

The surface of the molten mass becomes much agitated and the central region of this surface is raised a considerable fraction of an inch above its circumferential region. The metal or alloy is, in fact, subjected to a vigorous stirring action. Metal flows vertically upward in the axial region and downward in the circumferential region, and thus an alloy becomes automatically most thoroughly mixed. This stirring action is not a thermal phenomenon, but is caused solely by the action of the electromagnetic forces. Its importance is easily recognized when a perfect mix of the constituents of the alloy is desired.

It is claimed that excellent results are readily obtained in this method of heating, as all conducting materials may be raised to 2500 deg., or 2800 deg. C., or to their vaporization temperature in an oxidizing atmosphere. Platinum is easily melted in this way. By placing the inductor coil on the outside of a quartz tube, which is closed at both top and bottom, melts may be made in any atmosphere or in vacuum.

It is also held that in the open type of furnace, the molten metal can be drawn off from the bottom into a mould and the quantity of metal, which can be handled at a single melt, is determined wholly by the size of the furnace employed and the power available. An inductor coil of 40 turns, 6 in. long by 3½ in. inside diameter, supplied with 10 to 20 k.w., will melt 4 lbs. of electrolytic nickel or iron at a charge in from 20 to 30 minutes. Larger furnaces supplied with larger power will handle larger quantities.

It is noted that Moissan's researches were chiefly concerned with the chemistry of the elements at the temperature of the arc. He studied the chemical reactions at elevated temperatures of the most refractory substances and compounds, producing oxides, phosphides, arsenides, carbides, and silicides of all the more refractory metals. He showed that the silicides of carbon possessed a hardness which approaches that of the diamond. His crystals of carbon silicide (carborundum) readily scratched the ruby.



GENERAL VIEW OF THE FURNACE.

It was found that no metal was so refractory that it failed to melt in kilogram quantities in his carbon arc furnaces. But these melts were all made in a carbonaceous atmosphere and the resulting product, in the cases of the higher melting metals, was always a carbide of the metal and not the pure metal. Many years passed after the work done by Moissan, before the soft and ductile properties of pure molybdenum and pure tungsten became known; for small traces of carbon render these metals, as well as many others, extremely hard and non-ductile. Platinum and iridium, likewise, when melted in the carbon arc, become hard and brittle and their useful properties are largely lost.

In the past, workers in metals of the platinum group have had to resort to the oxy-hydrogen flame for producing and refining their products. The usual electric furnace, which produces the highest temperatures obtainable artificially, is useless for this work, as in many other cases, because in all types of electric furnaces heretofore used for obtaining extremely high temperature, the product treated becomes chemically combined with the carbon invariably present.

While the higher temperatures have been obtained with tubes of iridium or tungsten used as a resistor, the first is precluded for general use by its excessive price and volatile nature when carried to a high temperature, and the second, besides being very high in cost, can only be used in an inert atmosphere or in a vacuum. A great need has therefore been felt in finding an electric method of melting and producing alloys of such pure metals as nickel, chromium, electrolytic iron, platinum and even iridium.

There are many who hold that the alloys of such metals, if produced absolutely free from all chemical contamination of carbon, silicon and every other element likely to be found in vapor state at the highest temperatures, will exhibit special and useful properties. Furthermore, it is recognized as highly important in heat treating the higher melting pure metals to be able to preserve absolutely their chemical purity.

It will be seen that with this device a method is now available and commercially perfected whereby any metal or alloy in granular form, in small broken pieces, or in solid masses, can be melted absolutely free from carbon and all other chemical contamination, provided this metal fuses at a temperature under the fusion temperature of pure zirconia. The only apparatus needed is a source of high frequency current of 10,000 cycles per second, or over, and the special type of induction furnace indicated in the photograph.

INTERNAL COMBUSTION ENGINE IMPROVEMENTS

Important improvements continue to be made by British engineers in the Diesel oil engines which are being so largely adopted for marine purposes and for the generation of electricity on land. One recent innovation is intended to enable tar oil to be successfully used as the fuel. A pilot jet of paraffin is provided to form a flame for the following jet of tar oil, thus overcoming the difficulties of ignition. Another novelty which is of special interest to central station engineers is a device for automatically controlling the pressure of the air supply to suit the varying loads met with in the supply of electricity. On one end the same gauge is a pointer registering the air blast pressure and another controlled by the current passing through the generator. The second pointer is arranged to indicate the correct air pressure according to the load on the generator, and everything is in order when the two pointers are together, in which position they close an electrical circuit controlling the compressor throttle. When the pointers are apart, the throttle opens and increases the air supply until the pointers come together. Greatly improved combustion is secured by this ingenious device. Another British firm has introduced an emergency governor which stops the engine completely in case of an excessive rise in speed—an emergency which is beyond the ordinary governor. This apparatus works by by-passing the fuel into the atmosphere. Another emergency device stops the engine whenever the water circulation fails, the apparatus being operated by a diaphragm, which flattens when the water pressure upon it is withdrawn. All the British makers concerned in this field are standardizing their designs in order to provide the advantages of mass production.

WELDING REPAIRS TO WATER WHEEL

An electric welding repair job that is of considerable interest to the power plant operator and the mechanical engineering field in general, is shown in the accompanying illustration. In the initial construction of these water-wheels, difficulty has frequently been experienced in obtaining a firm and rigid connection where the vanes join the supporting rings. Generally speaking, the vanes are steel castings that are placed in position in the sand mold so that the molten iron will flow about the edges and form an integral casting. However, the result has often been unsatisfactory, as the subsequent expansion and contraction of the vanes and the rings causes a looseness in one or more of the connections. The peculiar construction of the vanes makes it difficult to use the oxy-acetylene process in uniting the vanes to the retaining rings, and relatively poor success has, so far, been obtained by the use of the electric process, when working together steel and cast iron. However, the St. Lawrence Welding Co., of Montreal, who accomplished the repair on the wheel here shown, have effectively formulated a special influx that overcomes former difficulties, and the vanes can be rigidly secured to the cast-iron rings, by means of the electric arc method, so that the force of a sledge upon any of the vanes will not produce the slightest defect in the welded joints. The cut shows the work immediately after welding; the rough appearance of the added metal was subsequently removed by grinding, leaving a smooth fillet weld in from the outer edges. Water-wheels treated in this way have shown greater efficiency after welding by this method.

BUILDING UP A WATERWHEEL RUNNER BY WELDING.

WHAT OUR READERS THINK AND DO

Wanted: Views on the Subject of This Letter

Editor, CANADIAN MACHINERY:

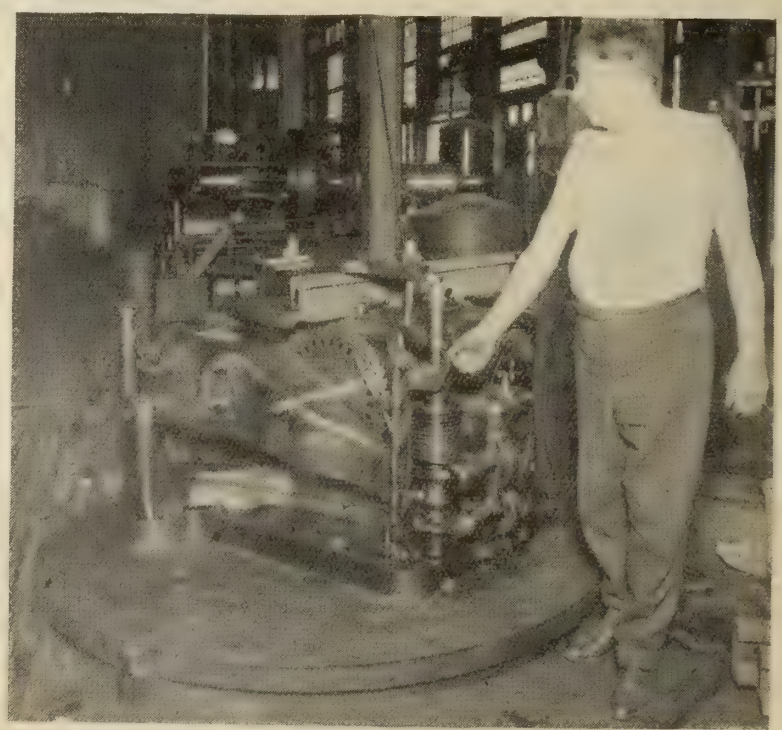
Dear Sir,—I take great interest in your mechanical drafting course, and note your reference to Mr. A. M. Lount, master mechanic for Massey-Harris. It is time some of the superintendents in this town sit up and take notice of the workman who is trying to get ahead of the game. Please let it be understood that the writer does not want, in any way, to discourage apprentices or workmen, but to give my honest opinion of conditions as I believe they are in most of the shops in Toronto to-day, I will quote a case in point. In one shop that I know of there is a young man, who, through home study, has got various ideas, and has submitted them to several firms where he has been employed. I might say at the start that he is one who is taking a course with the Scranton Schools, and his foreman is for ever running down these schools. Instead of giving the fellow encouragement it is entirely the opposite in this case. The young man conceived the idea that would have done away with one machine entirely in one operation, but would they try it out? Decidedly not. We hear much of this home study business. Is it worth while? Of course it helps one to hold down his job. The whole fault of the matter is this, that as soon as a man lets it be known that he can figure out ways and means of doing work in a more up-to-date manner than his foreman, then his foreman says: "I shall have to keep an eye on this fellow or by jingo he will be in my shoes before long." From this point on the poor fellow can look to his laurels. He is found fault with, and finally it is made so uncomfortable that he has to find fresh pastures, only to meet with the same rigmarole again. This is a true fact and can be proved up to the hilt. I appreciate such a man as Mr. Lount, as it shows that he does take an interest in his men, and if there were more of his kind there would not be so much antagonism between foreman and workman. I would say to the apprentice, stick to it; I am one who studies myself, and before long hope to be able to give something to the mechanical world that will be worth while. No doubt some of your readers will find for themselves that there are a lot of superintendents and foremen who are holding down jobs through the ideas of their workmen, who do not have the same opportunity of getting in touch with the heads of the concerns as their foremen have, and thus getting the credit every time for the ideas of their men. This state of affairs could be remedied by the offer of cash prizes for any improvements in the speeding up of production. Take for instance the following personal case: I was employed in one shop where they made a certain style of staple that could have been manufactured in two operations, or with even one operation, that at the present time goes through four. Why in the name of common sense is this allowed? Can someone explain? Yet this is only one of many cases I could point out. Hoping I have not taken up too much of your valuable space,

I remain,

Yours truly,

H. H. J.

Editor's note.—In our next issue we intend stating our views on this subject. In the meantime we will be pleased to hear from other readers, workmen, foremen, and superintendents alike on this subject.



HOW THE SAW OPERATES.

HANDLING LONG CUT-OFF JOBS IN CRAMPED PLACES

By J. J. McIntyre

The Cyrus Currier Co. of Newark, N.J., have to accomplish numerous cutting-off operations on railroad rails.

When the Earle-Rea Simplex saw, shown in the picture, was installed they secured it to a turntable, which can be clamped in a stationary position at any point in a circle. By this arrangement long lengths of rails can be cut at angles or loaded into machine from any point.

TAPER TURNING PROBLEM DISCUSSION

By George Barrett.

Reading Mr. Rodgers' article on Problems of Taper Turning in Nov. 13th edition of CANADIAN MACHINERY, brings to my memory a hot argument I had a few years back with a first-class lathe hand, who was cutting a taper thread with the tail stock set over method, just because it was too much trouble to connect up the taper attachment.

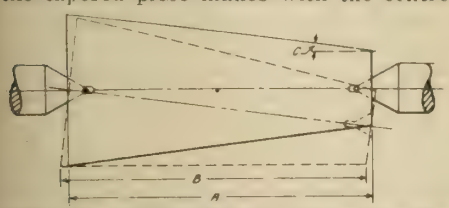
In setting over tail stock to cut a taper thread two errors will occur, and will be increased as the taper of the work increases.

The first error is in the pitch of the thread, which becomes finer than the standard as shown on my drawing.

The length of the work is A, if measured along the axis; if measured along the tapered surface the length is B, and to get this length you would have to use a trigonometrical formula and B would equal

$$\frac{a}{\text{cosine C}}$$

where C is the angle which the side of the tapered piece makes with the centre



THE IDEA EXPLAINED IN GRAPHIC FORM.

line. If the piece is threaded with a certain number of threads per inch, D, the number of threads in the whole length of the work, when threading by taper attachment would be A $\times$ D, but if threaded by the setting over of tail stock as shown by dotted lines in drawing the number of threads would be

$$\frac{A}{\cos C} \times D$$

or a greater number of threads, and consequently a finer pitch than with a taper attachment.

Example: Suppose the length A, measured parallel to the axis is 6 inches; assume that 16 threads per inch are to be cut and the angle C is 15 deg., the number of threads in the whole length of the work when cut by the taper attachment would be $A \times D = 16 \times 6 = 96$. Take the length B, shown by the dotted lines measured parallel to the outside, then the number of inches equals

$$\frac{6}{\cos 15^\circ}$$

The cosine of 15 degrees from any engineer's bankbook is .9659; and

$$\frac{6}{.9659} = 6.211$$

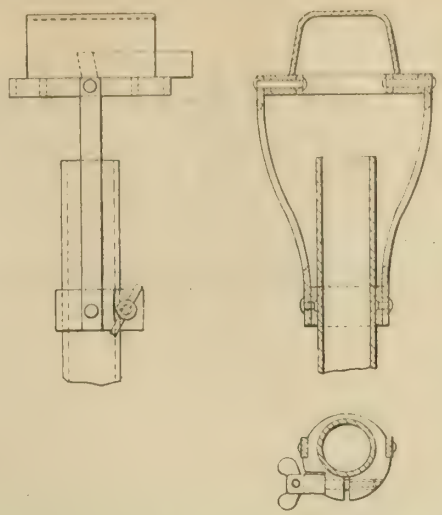
or nearly 6 7-32 inches.

therefore, $6.211'' \times 16 = 99.376$, or 99⅜ threads in the whole length of the work.

The second error would be that of a drunken thread. It is not a true continuous helic, and is due to the fact in taper trimming with the tail stock set over the work, does not turn with uniform angular velocity, while the tool is advancing along the work longitudinally with the uniform linear velocity.

The change of the pitch and the irregularity of the thread is so small it is not noticed with the naked eye, if the taper is slight.

But as the taper increases, the errors become more pronounced, therefore, the setting over of tail stock should be discouraged as much as possible.



TOOL-HEATING SUPPORT FOR BUNSEN BURNER

By F. HORNER

For heating fine tools for bending, hardening and tempering, the Bunsen burner is handy. To save the time and trouble of holding a tool in the tongs, the attachment shown herewith is valuable. It consists of a couple of rings riveted together with distance pieces between, the rivets also holding bent arms that go down to a clamping ring pinched on the tube with a thumb-screw. To conserve the heat and reduce the length of time of heating up, a hood can be laid on top. A mark may be scratched upon the tube when the best height according to the flame has been ascertained, so that the split collar may afterwards set to this line.

There are a few wells in the United States between 7,000 and 8,000 feet deep. At 7,000 feet the temperature was found to be 152 deg. Fahr., and the rate of increase at this depth is about 1 deg. in every 51 feet. At this rate the temperature would be pretty close to the boiling point, 312 deg., at 10,000 feet. This has been the theory of scientists for years, and it is strange that more effort has not been made to find natural heat and put it to use. Boiling springs and burning volcanoes are proof that fire exists in the bowels of the earth and heat will undoubtedly be drawn from wells at some future date.

February then has one day more.

WELDING AND CUTTING

Why is Welding Profitable?

By DAVID BAXTER*

IF you are in doubt as to the advisability of installing an oxy-acetylene welding plant; if you think there are already too many engaged in the welding business; if you thing it is not a success as far as the process has been developed for all-round repair work; if you think there is liable to be a state of depression, of slack work in business in the future; if you think the welding business is not a paying one; in fact, if for any reason you are hesitating on the verge of purchasing a welding plant, you should read the encouraging prophecies, estimates and facts incorporated in this article.

If you already own a welder and are wondering whether or not to purchase additional equipment; if you think maybe you can rub along with your present outfit; if you think you can handle your share of the work in the future without the new improved accessories, supplies, etc.; if you have been dreaming around and have not kept posted with the facts concerning the tremendous era of development upon which this country has embarked; if you are out of date in equipment and information concerning the wonderful possibilities opening before the oxy-acetylene welder you should be interested in the following discussion.

If for any reason you think it takes a sort of super-mechanic to learn to operate the welding torch; if you believe it takes too much time and patience for the rewards to be earned; if you believe you would only have the plant sitting around idle half the time; in a word, if you do not know just exactly where you stand in relation to the welding business, the following article should prove interesting.

* * *

It is estimated in a recent issue of a leading automobile paper that the farms of America will absorb two million auto trucks in the next ten years. Can we realize what this means to the repair man, and especially the welder? Can we grasp the idea of the enormous amount of welding this great number of trucks will make? If we knew absolutely that there would soon be in use two million trucks, would it be possible to realize what this would mean to the owner or operator of a first-class welder? No doubt the figures would be staggering in their significance if we were able to put it in round numbers. It would seem almost impossible to get welders enough to keep the trucks in running order. And all of this would be on top of the thousands of passenger cars already in use together with the enormous number yet to come.

This estimate may be a trifle overdrawn, but those of us who have kept in touch with the highways movement of to-day can readily understand what it means to the truck business. Already some of the railroads admit that they are out of the running in so far as the short haul is concerned. The short distance hauling of freight in the near future will no doubt be done with motor trucks. Of course a great deal of this depends upon the rapidity with which the country adopts and installs good hard road systems. With the coming of hard roads comes the repair work for the welder. It is the truth in more ways than one that prosperity travels on hard roads.

Good roads are no detriment to the welder's business because the better the roads the harder they will drive and the quicker wear or break the trucks. It is scarcely necessary to make the reminder that all running machinery wears in time, so that even with the best of roads there will be plenty of work for the repair man. With the aid of the Federal Government there will be many roads built within the next year, and miles upon miles to be built in the following years. Now, if you believe in hard roads you must believe in the oxy-acetylene welder, for they will travel hand in hand.

So prepare for the business coming and install your plant, or get additional and better equipment if you now own a plant. Almost every part of a motor truck or automobile can be welded. In fact, this is the only method by which most of the parts can be repaired. Due to their shape and to the metal of which they are made, many of the different parts of motor cars would have to be thrown away if it were not for the modern method of welding. Such parts as crank cases, housing, crank shafts, etc., had to be discarded before the oxy-acetylene torch was devised.

For those who think there are too many welders in the business; consider the two million trucks for the farms, then to this add the trucks that will be used in the cities to accommodate this increase in volume of business. Then to that add the number of pleasure cars which will be bought with the profits of the double earning power of the trucks as compared with the slower team and wagon. You may say, "That is for the future, only a prospect. What about right now?" Well, just look around you and see how many torch operators who really understand their business are not busy. Ten chances to one you will find they are not complaining. You may find some idle plants, but you will also find they do not understand the work or else they do not let people know what they can do. No, there are not too many welders in the game. In fact, there is a scarcity right now, and what will it be when two million trucks are added to the list?

Those who are doubtful about the success of the oxy-acetylene process should turn to Government statistics. They will find therein where thousands of welders were used on all kinds of shipbuilding and war work. This is speaking of both the repair work and the manufacturing end of the business. One instance should convince the most skeptical concerning the success of the modern welding machine in repair work. Several of the largest ships that were taken from the Germans were found to be badly damaged. In fact, so badly damaged that it seemed impossible to ever repair them. The Germans had taken heavy hammers, bars, etc., and broken into many pieces some of the most essential engine and machine castings about the ships. Great complex castings that would require months to replace were found to be broken into several pieces while yet in place on the machine. Steel frames and bars were bent double in an effort to put the ship out of commission for a long time, and as the Germans hoped, permanently. If it hadn't been for the oxy-acetylene welder they would have succeeded, too! But the torch operator was put on the job and got the ships back in running condition in anywhere from one-tenth to one-half the time required to replace the castings. Now, if those large

*From "Acetylene Journal."

ship castings can be welded any kind can, so why should anyone doubt the ability of the welding process?

But you don't need to be told of the Government work to be assured of the success of the welder; just spend a day in any good welding shop. You will find any and all kinds of work successfully handled. You will find that they weld castings weighing a ton or more just as effectively as they weld a smaller job. In fact, an instance comes to mind of one torch operator who welded the time regulator of a common watch, a part so small it will not weigh except on very delicate scales.

Now, as to whether the welding business is a paying one or not; ask any owner of a large expensive automobile which he would rather do: pay thirty dollars to have his cylinder block welded or pay several hundred for a new one. You can weld an ordinary break in a cylinder block in a few hours at a cost of four or five dollars. Some that are badly broken will bring sixty or seventy-five dollars. Of course, this is not the common line of work that comes to the welding shop, but a good operator can make good money eight hours a day welding pump handles and stove legs. He can weld a hundred pump handles at fifty cents a piece in a day and not work hard, either. By pump handles is meant the common run of small tinker jobs. The operator must know his business; the machine won't do the head work. And, by the way, that is one mistake the maker of welding machines often makes; he leads the purchaser, unintentionally perhaps, to believe all he needs is the machine. He should impress upon his customer that it is comparatively hard to do good welding but it is very easy to learn to do good work. The operator must learn the nature of different metals and how to handle them. Anyone with average intelligence and mechanical ability can learn to operate the welding torch. Although very few can take right hold of it and do good welding without practice.

Let us revert again to the owner of an apparatus who is in doubt about adding to his equipment: He should add to his equipment now, or soon. Why? Because there is another large field for repair work ahead. This is the tractor business. If there will be two million trucks, does it require a very great stretch of reasoning power to realize that the tractor business will be nearly as large? And the tractors will probably furnish more repair work than the trucks by reason of the kind of work they do. Could any form of work be harder on machinery than plowing? Here is something that will wear and break all kinds of castings and forgings faster than most of us realize. Nor will the farmer spare the tractor when it comes to putting in the immense acreage required to feed the war-stricken world. He will plow and till at breakneck speed day and night. The tractors will naturally wear and break under the strain. Then the farmer will want it repaired as quickly as possible. He will be in poor shape if you are not equipped to do the work immediately. Remember there is no part of a tractor you cannot repair with a welder, even scored cylinders.

Aside from this big rush of business there are other reasons why you should be fully equipped. It is foolish to weld a job with a torch too large; it wastes gas and probably makes a poor weld. And it is just as bad to weld with a torch too small for the job; it wastes time and gas, too. It is foolish, too, to have a torch clog up in the middle of a job and have to stop and clean it. Much better have several torches in the shop whereby a quick change can be made, or the correct size selected for the work to be done. In event of a torch getting damaged or broken the welder would probably lose enough money to pay for several torches by being forced to wait several weeks for a new torch to arrive from the factory. These things argue for at least two torches to each operator.

Some of you who may be rubbing along with old style welding equipment do not know that this is in many instances a loss of time and money. There are now being manufactured new designed and constructed devices and attachments that will save enough time and material to pay for themselves in a very short time considering the inadequacy of the older apparatus. It is a mistaken idea to think a torch operator can compete with up-to-date apparatus by sticking to his old-style equipment. He should know that manufacturers are continually straining to design and build better machines, more economical and less fool-proof. If he is really following up the business he should keep in touch with progress or some day he may awake to find the other fellow is taking all the cream, because he is continually trying to improve.

There is a cheap and easy way to keep up to date on what is doing in the welding world. Subscribe for a trade paper, then read it and study the things you read; look at them from the angle that applies to your particular situation. And don't neglect the advertisements; read all of them and examine the pictures contained in them. Didn't you ever pick up any useful information from reading the ads.? Hasn't it ever occurred to you that an ad. furnished just the idea you were looking for to apply to some vexing problem? Has an ad. ever furnished to you the starting hint that helped you work out a hard problem? Hasn't the cut in an advertisement ever shown to you something you wanted to know? If not, then it must be that you do not read the ads. rightly. They should be read as one would read the news items of his trade paper, for they are in reality the newsiest kind of news items. All the new discoveries, the new inventions, the new supplies, even a great many trade secrets are inserted in the advertisements. Often the mere wording and picture suggests some way of improving your own method. You will find that the fellow who gets ahead is reading the advertisements as much as any part of his paper.

Yes, the welder who succeeds must keep his mind up to date as well as his equipment. Some of them are going to find this out to their sorrow in the near future if they try unprepared to meet the coming expansion and prosperity in these United States. Now if anyone doubts that we are entering upon an era of prosperity let them investigate the municipal improvements that are being installed in all parts of the country. Visit some of the little villages out on the prairie in Kansas and see how they are paving and installing sewers, etc. When the towns of five to ten thousand population commence to pave their streets it is good sign that the country at large is prospering.

These things all point to a happy time for the repair man; in our case especially the welding machine operator. Did it ever strike you how nature balances things? The great wear and tear of machinery is balanced by the oxy-acetylene welding machine. It looks as though nature prepared in advance for the coming era of production by permitting the welding apparatus to be invented and perfected in advance.

Many farmers and residents of small towns are rapidly adopting power for the doing of many things. They grind their feed, churn their butter, pump their water, wash their clothes, and do many other things by machinery. This is another line that is enlarging by leaps and bounds. It is one worthy of careful thought. The repair welder is bound to reap a benefit from this enlarging tendency to let power do the work. Where power does the work it takes its toll in repair bills. Once more the welder is the best fitted to cope with the situation; he is the only one who can successfully repair these machines that are made of metal. And there is no danger of the individual installing his own welding apparatus on account of the time and concentration it takes to learn the business of successfully welding all kinds of metal. A tiny outfit will probably never be manufactured for home use since it would be impracticable for all kinds of general repairing. Therefore, there will always be a central welding shop.

Let us next try to refute the arguments that the welding plant is apt to stand idle a lot of the time: In the first place, there are so many different things that the plant may be used for there is no necessity for it to stand idle. These things are all aside from the usual work of repairing broken parts. The welding torch may also be used to case-harden tools and wearing parts; it may be used for melting babbitt; for burning grease off of tanks and cars; for melting caulking out of sewer pipe; for brazing and lead burning; for reclaiming defective castings in foundries; for heating castings to be shrunk on or removed from shafting; for removing boiler scale; for brazing, soldering, etc.; for manufacturing or wrecking; for opening steel safes;

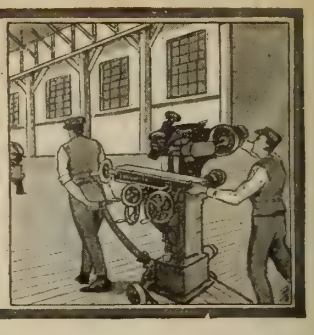
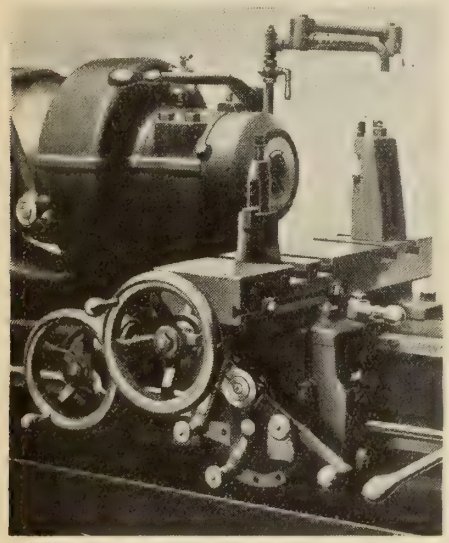
DEVELOPMENTS IN SHOP EQUIPMENT



NEW TURRET LATHE

The Warner & Swasey Company of Cleveland, Ohio, have placed on the market what is known as their No. 6 Turret Lathe equipped with double friction back gears, and with or without automatic chuck, bar feed, and



CLOSE UP VIEW OF SADDLE.

power feed to turret. Either the standard or heavy duty carriage is furnished with the machine.

Double friction back gears increase the productive ability over the single back geared machine by almost doubling the power and giving a greater speed range. With this construction nine spindle speeds are available, three for each step of the driving cone.

The power obtainable with the double friction back gears permits taking heavy forming and facing cuts on both bar and chucking jobs which are beyond the capacity of the single back geared type. When used for these heavier cuts the heavy duty carriage is preferable.

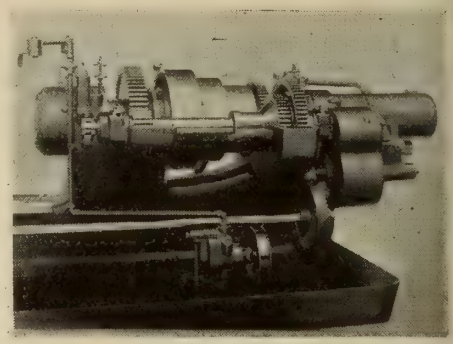
The heavy duty carriage has power cross and hand longitudinal feeds. The cross feed can also be operated by hand. Six power cross feeds and reverse are obtainable in the apron; the three finer feeds are ideal for forming, and the three coarser are suited to facing. The gears in the apron of this carriage are made of special steel and run in oil.

The cross slide is fitted with a dial graduated to .002 in. Adjustable stops are provided for either direction. The front tool post is round, has an adjustable wedge, and is arranged to be swiveled at any angle. A cutting off tool holder is regularly furnished for the rear. Either of these tool holders may be removd and forming tool holders substituted, or necking tool blocks, or any number of other tool holders, some of which are shown in the catalogue "Turret Lathe Tools."

With this heavy duty carriage on the No. 6 Turret Lathe, gear blanks, forgings, and tough alloy steels requiring heavy forming and facing cuts are handled to great advantage. Then, too, it is as easy to operate on the ordinary jobs as a machine without its reserve strength.

The standard carriage is the type that has been furnished on Warner and Swasey Turret Lathes for several years. Hand longitudinal and cross feeds are regular features of this type. Work requiring power cross feeds are best handled with the heavy duty carriage and power cross feed. Adjustable stops are provided for the cross slide. The round tool post for the front and the cutting off tool holder for the rear of the cross slide are similar to those furnished with the heavy duty carriage.

Hexagon turret is arranged for holding tools with or without shanks. The

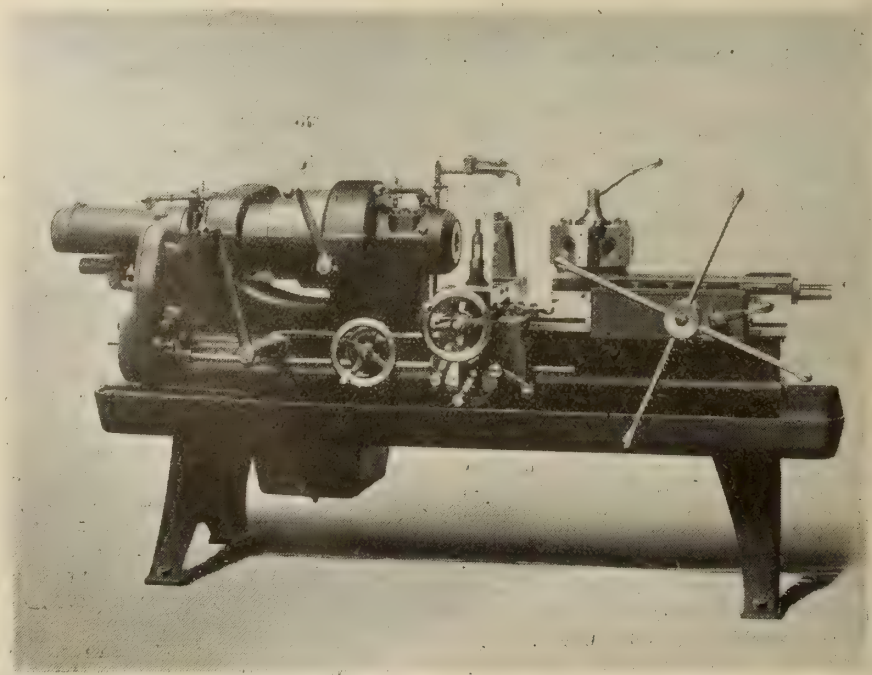


REAR VIEW SHOWING DOUBLE FRICTION BACK GEARS.

six-tool holes, counterbored for centering plate tools, are fitted with draw bolts and are bored 1¾ inches in diameter, unless ordered otherwise. Bolt holes are provided for securing plate tools to the faces.

The turret is revolved automatically by the backward movement of the slide. The locking bolt is at the front end of the slide, and works into steel taper bushings inserted in the bottom of the turret close to its outside edge, directly under the cutting tool.

Independent adjustable stops operate automatically for each position of the turret, and disengage the power feeds.



GENERAL VIEW OF THE LATHE.

They are readily adjustable for the length of each cut.

Turret saddle has a supplementary taper base to adjust the tool holes in turret to exact height of centre of spindle. Taper gibs, fitted the whole length of the saddle on each side, provide means for adjusting the slide sideways.

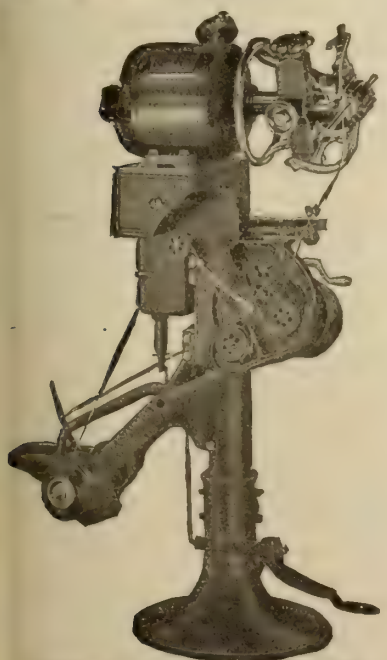
Power feed for turret slide is furnished when especially ordered. Any one of the four changes (38, 64, 107, 190) is instantly obtainable by moving lever. The automatic trip operates in connection with independent adjustable stops for each hole in turret.

An oil pump delivers a steady and abundant flow of cutting lubricant to the cutting tools. The pump operates when the machine is run in either direction.

NEW ARMATURE WINDER

The P. E. Chapman Electrical Works, of St. Louis, Mo., announces a much more complete model of the Chapman Adjustable Bipolar Drum Armature Winding Machine, in their style 3 as shown herewith. This model in addition to being adjustable in a few minutes for any style and size of random wound bipolar drum armatures and any size of wire from No. 20 to No. 36, has some special features enabling it to wind a very great amount of wire into armature slots without pounding the wire, and also has some unique lead forming and handling features reducing the labor on this part of armature winding.

Driving motor, controller, turn counter and other necessary parts are all integral parts of the machine, in fact, the machine is complete in itself.



GENERAL VIEW OF THE WINDER.

A new automatic dynamometer controlled real holder and tension device has been perfected, which it is claimed stops all spool troubles and enables quick starting, high speed, great tension and quick stops, so that only about five seconds are required to wind in a coil. This reel holder and tension device are simultaneously adjusted for any sizes of wire by a simple crank, and once adjusted needs no further attention until reel is empty. It is said the announcement of this device has been held back long enough to prove the machine a success in actual practice. In one case an output of nearly 600 per day was obtained where the estimate was 200 to 250. It is claimed that the output of the machines runs into hundreds of armatures per day on many sizes and kinds of armatures; that the saving over hand winding usually is anywhere from 10 to 30 to 1 or even better. It is claimed that the machine is easy to operate, well and strongly built; that it is useful both in the job shop and in the factory. The machine is also useful for winding field coils, smaller armature coils, etc.

W & A KEY SLOTTER

The Grob Hardware Corporation, of New York, sends us the following data regarding W & A key slotters.

In manufacturing machine or automobile parts in quantities, it very frequently happens that keyways or irregular-shaped holes are to be machined. Sometimes the proceedure is to do this work on a broaching machine or keyseater. A special broach must be made to the shape required, or if keyways are to be cut, a saw-shaped cutter-bar, the width of the keyslot. The cost of the tools alone is a serious item, which ranges anywhere from fifty to several hundreds of dollars. There is always a delay in getting these tools, sometimes several weeks, and there is also the possibility of breaking them, which means more delay and expense.

The W & A slotter will do a large volume of this work with practically no outlay for tools. Any shape can be machined, and, in many cases, in less time than a broaching machine could do it. The ordinary high-speed tool bit only is used, which is ground or formed to any shape or width. If broken, it can be replaced at a trifling expense, without delay. The slotter is instantly available for jobs within its rangs, and many thousands of parts can have the necessary machine operations performed on them and the job completed before a broach or special tool could be made.

The tilting table is a feature of great value. This allows the cutting of slots in tapered holes, the machining of all tapered work, and the rapid execution of a multitude of jobs which are within the range of neither broach nor keyseater, also entirely without the use of special tools.

In the tool-room, where a large variety of work is produced, this slotter will be found invaluable. Profiling, blanking dies, cutting clearances, filing and shaping of difficult pieces, are a few of the operations that can be accomplished with economy and ease, while another important feature is that the work is in plain view at all times.

The widest keyway that can be cut at once is ⅜ in. wide by 4¼ in. long in cast iron and 5-16 in. wide by 4¼ in. long in machine steel. A keyway of these dimensions can be cut in about one minute, either straight or tapered. The maximum stroke of the ram being 4½ in. Provision is made on all machines for attaching drive pulleys and countershaft. This will make a complete individual unit with three speeds, at small additional expense.

ELECTRIC WATER HEATER

The Bridgeport Machine & Tool Mfg. Co., Inc., of Bridgeport, Conn., have recently placed on the market an electric heater which can be used for the heating of water in factories, etc.

This device claims the following features: Clean, sanitary, and sterilized hot water, boiling hot if you desire, instantaneously, then natural cold water

BRIDGEPORT WATER HEATER

through the same faucet. A double valve faucet does not allow the cold water to pass over a red-hot resistance element. The same device will operate on either alternating or direct current.

To install, first remove the ordinary faucet and mount the Geyser. It is equipped to take standard ½-inch pipe. The name plate designates the voltage and amperage, which is all that is necessary to ascertain the proper size wire to be used for connecting direct from the meter to our device.

The two voltages supplied are their

110 Volt ..... 60 Amp.
220 Volt ..... 30 Amp.

but they can supply any voltage desired.

Afraid to Let Go

WHAT is going to happen when the United States comes to the point when it must hand back the railroads of the republic to their owners?

That day is being postponed as far as possible. Every time it looms up as a sudden possibility some person comes along and shoves it a little farther into the future.

There is a peculiar proposition to be smoothed out in those same railroads. They are losing money, and it looks as though they were going to continue to lose money. The Government officials, when they had charge of the road, brought in the McAdoo award, which has put on a burden which only the very strongest and most fit can think of handling.

Supposing the private companies got those roads again to-morrow? What would they do with them? They would first of all have to start on the process of making them pay their way.

A Government road does not have to pay in order to exist. When a deficit occurs it has been shown that the easiest way out is to call on the Government for a grant and for an order increasing freight or passenger rates, or both.

Such practices may be all right for a short time under very unusual circumstances, but a continuation of them is the making of a catastrophe.

If the roads of United States were unconditionally handed back to the owners, and the owners were to start at once trying to make both ends meet, there would be trouble right straight off, and it might be serious enough trouble.

The trouble with too many Government departments, both in United States and Canada, is that they do not get a dollar's worth of value for a dollar spent. A private company has got to get its money's worth for money paid out, or something pretty close to it. If it does not, then there is bound to be trouble.

It begins to look as though the U. S. Government were afraid to let the owners of the roads come in and put the axe to the pile of multiplying expenditures that have been banked up against the earnings of the companies.

The Changing Mechanical Field

THE field of mechanical operations is changing in Canada. Perhaps the change can be noticed more quickly in United States, but it is coming here, and in a very marked form. The manufacture of automobiles may furnish the illustration for the case in point.

Take, for instance, the manner of treating cylinder blocks. Machines are in operation that bore out eight holes at once, where before it would have meant that a boring mill would have to have been employed to do the eight holes, one at a time.

Then there is another machine that at one operation will drill 47 holes at one time in the cylinder block. Previously this would have been done on an ordinary drill press, and the forty-seven holes would have been drilled one at a time.

Take the tapping of cylinder blocks. Here are two giant machines, twins you might call them, operating on 38 holes, 14 on one machine and 24 on the other. The machines are connected by a set of rails. A special jig slides on this rail from one machine to the other. This, in former days, would have been done by a tapping chuck, or farther back still, by hand, one at a time.

These operations are mentioned here simply to show that industry is changing rapidly to keep pace with the developments peculiar to the age.

Shop practice that was considered good enough a few years ago is now out of the question. It is a case of quantity production, and it opens one of the greatest fields possible for the mechanic who wishes to apply himself seriously to the problems that are confronting the shops that are working on such output as automobiles and parts thereof.

This refers not only to the design of machine tools, but to small tools to accompany them

It is a great study, and the chances are great in proportion.

But Times Have Changed

IN them there days what's went and gone and never to return; them days, my son, for which we sigh, for which we groan and yearn—we used to take a basket, then, around the Christmas time, and kick up quite a rumpus on two nickels and a dime.

We'd wander toward the market then, in homespun garb, my dear; with woollen socks upon our feet and wool tab on the ear.

We'd buy a turkey in them days—it did not strain our purse, nor yet did cause us to bust out in words that smelt of curse. We wandered through the grocery store, ah, yes, we did, by heck! Of currants and raisins and such truck, we bought 'em by the peck.

The gatherin' up of trinkets, too, it was a simple thing—we were not buyin' in them days as though for some fat king—in simple taste we sallied out and ere we went a block, we'd got for dad, in grey and red, a brand new Christmas sock.

But folks don't turn to them things now like what we used to do—the chance for gettin' past that way is mighty thin and few. For Christmas now we've got to go and dig down in our jeans, and peel from off our shrivelled wad the last few greasy beans.

We've got to give a motor bus, a gold watch or a farm—yes, scat you simple, woolly things what's weaved in braid and yarn.

Perhaps it's best that things should be just as they is to-day, as long as folks has got the cash to spill about that way—but I can't help just hankerin' back to them there days what's sped, when folks at Christmas time of year kept steady in the head. When we could saunter forth at ease around this buyin' time, and make a reg'lar rumpus on two nickels and a dime.—ARK.

The Tunnel Will Be Built

FOR years engineers have talked of the day when the tunnel would be completed between England and France. The world in general has not been much interested, probably because the world in general never thought such a thing practicable.

But work is going to start—start from both sides, the French and English Governments to find an equal share of the money and provide an equal share of the men.

Then it will be possible to take a train at London for Constantinople, for any European capital. Through the tunnel the line will be run by electric power. This will prevent trouble with engine fumes, which was one of the serious objections to the long tunnel through the Alps.

Forty-five minutes will be occupied in going through the Channel tunnel. Passengers, in fact, will pass through the tunnel almost without realizing they are passing under stormy Straits.

The tunnel will be about thirty miles long. It will not be exactly in a straight line. Beginning at a spot two or three miles on the island side of Dover, it will follow the gray chalk bed of the Channel, which is impervious to water and suitable for tunnel construction, and come out at a point between Calais and Boulogne, near the village of Marquise.

There will be, as on the London underground railways, two distinct tubes. Below them, about nine feet in diameter, will be a drainage tunnel. The whole work will take five years to complete and will employ 1,200 men on each side.

The French, who are proud of their share in the tunnel, will do half the work and find half the money. There is bound to be much friendly rivalry between the two sections of workers as to which will go ahead the faster.

According to exact calculations of the engineers, the French and British workers, who will begin construction of the tunnel thirty miles apart, will meet within an inch or two of the centre of the tunnel.

Doing Things Well

A GLANCE over the list of things for which merit and demerit marks are given on the C.P.R. system makes it clear that strict attention to business is insisted upon by this great company.

For instance, merit marks are given for these reasons:

Engineer—Detected broken rail, while in charge of passenger train and arranged to have same protected and replaced.

Engineer, fireman, brakeman—Discovered broken angle bars in track and took prompt action to have same repaired.

Section Foreman—Noticed brake beam down on coal car, on passing train, signalled train to stop and assisted in removing beam.

Trainman—Discovered two broken arch bars on freight train.

Trainman—For taking prompt action when he noticed sparks falling on oil house roof, and preventing roof catching fire, resulting in no damage being done.

Demerit marks come from failure to attend to business. Little things, perhaps. Caused no train wrecks. Lost no lives, but made it harder to give good service.

The C.P.R. is claimed to be 90 per cent. efficient in operation. It attends to details. It takes little or nothing for granted. It refuses to "take a chance."

What is good for the C.P.R. may be good for you, or for your concern. Make it your business to do things well.

POLITICIANS are keen to get a glimpse of the next Premier. But there's many a manufacturer who would much rather get a squint at the man who can deliver him a car of steel in sizes and shapes that he wants.

Let Up On Machine Shops

By DONALD HAMPSON

Just as every summer there appears a long list of drowning accidents, so does every summer and fall bring its quota of killed and maimed from farming machinery. Manufacturers who have been compelled by law to guard every possible and impossible point of danger in their plants, and have been heckled to the limit of endurance by officious inspectors and insurance men view with amazement the appalling disasters that are allowed to continue on the farm without interference. It is a fact that every issue of country newspapers during the season mentioned contains at least one account of fingers or hands cut off in ensilage choppers, legs cut off in mowing machines, men suffocated or burned to death in silos, fingers lost in unprotected "cogs" of gasoline-driven machinery, and so forth through a really frightful list of accidents made worse because the victims are usually alone and miles from skilled attendance.

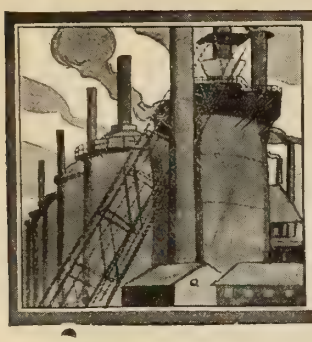
There was a time when machine shops were considered somewhat dangerous and the mighty hand of law was laid upon them never to be removed. However, this is all changed, and machine shop men and industrials generally feel that they are getting too much law while law is calmly "swallowing the camel" of the other fellow. Machine shop accidents to-day are of minor nature and almost never serious—the maimed workman is almost impossible to find. The writer knows of one shop of ninety men that has four among the number who are maimed to a greater or lesser degree (from lost fingers to lost feet) and every one of these four was injured on the farm. Any one of these accidents, and they are typical, would have made a great deal of trouble for the management had they occurred in the shop and would have cost from a hundred to ten thousand dollars through adjustments following, but the farm owner can proceed unmolested and his injured employee can learn to use a knife with his left hand, the only comfort (?) to be gained is that often the owner himself is the victim. Viewed from every standpoint, the shop men are justified in asking for no more regulations until the laws go after the really dangerous occupation of farming.

Aside from the features just detailed, mechanical men cannot help but wonder at the lack of guards on the products of manufacturers of farming machinery. Designers of every other class of machinery make guards and locks and safeties an integral part of the product, finding that it adds almost nothing to the cost while frequently it makes for increased efficiency and output. The farm machinery business forms too large a portion of the metal-working industry to continue in the useless sacrifice of life and limb.

AND now they are advocating an eight-hour day for farmers. When we was young we used to have the eight-hour day on the farm—one before dinner and another after.

* * *

TORONTO City Council failed to order compulsory vaccination. What else could be expected? With elections only a few weeks off who'd vote for a man who made him get scratched?



MARKET DEVELOPMENTS

Prices Going Up for New Machine Tools

Several Notices of Advances Have Been Received by Dealers This Week—Exchange Rate Also Helps to Make it Quite a Lift for the Canadian Buyer

PITTSBURGH despatches take some delight in stating that the steel strike has been broken, and the coal strike called off. That is good news, no doubt, but other Pittsburgh despatches, based on a knowledge of the steel industry, state plainly that it will probably be well on in March before a normal production can be expected from the steel mills. It all means that the Canadian industrial world will have to go easy—very easy in spots—in order to make the available steel spread over the scarce period. It also means that prices are going to be more than firm—they are going to be supplemented by a premium list which is already very much in evidence. It is hardly worth while publishing a list for jobbers just now because prices are only quoted against specific demand. Many jobbers have nothing to quote on in plate, sheets, tubes, etc., so a price list is unnecessary in their establishment.

When will the top come to the machine tool market? Just this week many Toronto dealers were notified of advances averaging around ten per cent. on standard lines. But they claim that it does not affect the sales, as the price is not nearly such an item as the ability to produce the machine. The exchange rate, duty and war tax now brings the price of a machine made in United States to an easy fifty per cent. advance over the price the American manufacturer has to pay. However, prices of machine tools are based largely on the figures prevailing at the time of delivery, and as deliveries are pretty well off into the future now the exchange rate may have righted itself before many more deliveries are made.

There is an acute shortage of cast iron scrap in the country at present, and no indications are in sight that any relief is forthcoming. This material generally comes from breaking down old plants or replacing old with new machinery. Otherwise the scrap market, especially brass and copper, is uninteresting and dull.

MONTREAL PORT HAS NOW BEEN CLOSED UP FOR WINTER SEASON

Special to CANADIAN MACHINERY.

MONTREAL, Que., December 18.—The closing of the port has virtually put the winter garment on Montreal, and especially in the vicinity of the harbor the decrease of activity is quite pronounced. Business generally has taken on a quieter tone, and this is particularly evident in many of the smaller metal working plants, where active operations are falling off. Dealers in steel lines intimate that business is still jogging along, with poor delivery still the factor of present trading. It is believed that some time will elapse before normal operations will be resumed. Coal supplies are uncertain and all parties are urged to exercise conservative policies. Machine tool movement is regulated by delivery from the States, and buyers are showing reluctance to purchase under existing conditions when adverse exchange is an important factor.

Scrap conditions are improving, but buying is not pronounced.

Slow Improvements in Steel

Despite the fact that the coal strike has ended and that recent restrictions on coal consumption has been partially removed, the situation as regards supply for industrial purposes is still sufficiently serious as to demand every precaution in the use of fuel, as the immediate supply is not ample to meet the full requirements of normal activity. The conservative burning of soft coal is almost as essential to-day as it was before the recent conference, and it will be some weeks yet before depleted piles can be replenished from the re-worked areas. The local situation is not causing undue concern, but all recognize the urgent necessity of reasonable conservation of supplies on hand. Many of the steel plants that were forced to close during the past week or two, in the States, are again active, and resumption of normal operations will, no doubt, be reflected here in the better delivery of ordered material, a condition that has been none too good for some time back. Dealers here are anticipating a quiet period until after the New Year, when some active buying is expected. The conviction that prices now ruling are likely to abide for a considerable period is firmly impressed upon the minds of most manufacturers and consumers, and early developments in the way of deferred industrial enterprise is not unlikely early in the New Year. In many lines of steel commodities the prices quoted are more as a guide than the actual figures at which sales are made, and when existing conditions are seriously considered it will be readily understood that present sales are invariably made on the merits of each individual transaction. Dealers here state that the prices quoted are a fair average of those generally figuring in current sales.

Strength Developing in Metals

There is a firmer tone ruling in the non-ferrous market, due to the more settled condition following the return to work of the coal miners. The demand has not shown any heavy increase, but the inquiry shows a more optimistic spirit on the part of consumers. The financial condition at present is the chief factor affecting business, particularly where purchases are made in the States. Dealers report a fair business in ingot metals but state that sheet movement is still restricted owing to the inability of obtaining sufficient to meet the trade requirements. Little galvanized material is carried in stock.

Quotations are unchanged, but a firm-

ness is evident that may result in stronger prices shortly.

Strength Appearing in Scrap

Following the resumption of normal steel operations as a consequence of the coal strike settlement, the market in old materials has shown slight improvement but no heavy buying improvements has developed, although the better inquiry would indicate that consumers are again looking for supplies. This has added to the strength of the situation and dealers report a steady firming in market conditions, a factor that will probably be reflected in an early upward revision of prices. Local dealers, however, are not looking for any great activity before the close of the year as the season's festivities generally have a bearing on business at this time of the year.

ADVANCES MADE IN THE SELLING PRICES

TORONTO.—There is practically no change in the machinery and steel market this week. Dealers in all lines are still figuring on what can be done to bring deliveries up to something that will keep pace with the requirements that are being placed upon the trade.

The exchange rate is not helping the sale of tools that are brought in here from across the line, but dealers are not certain that their business is suffering at all in consequence.

In some lines there is, generally, a little falling off during the season immediately around Christmas, but there is no reason to suppose that the same influence will not operate this year, although it is not much in evidence yet.

More Advances Made

In several instances this week, CANADIAN MACHINERY was informed that advices had been received of advances to the selling prices of several lines. One well-known firm making shapers, automatics, milling machines, etc., notified their agent of a five per cent. advance on December 8, while in another case the head of one Toronto machinery concern stated that the mail he was opening had brought in several notices of ten per cent. advances.

"Does that affect the volume of business you are booking?" asked CANADIAN MACHINERY.

"Not that we notice,' was the reply. 'The big thing just now is being able to get the machine wanted at all. The biggest bother is in getting in touch at once with all the outstanding quotations, notifying them that the figures that had been furnished to them have since been withdrawn. There is more annoyance from this than anything else, as we often have customers who imagine we should be able to get in and place their business at the price that has just been withdrawn. The exchange rate, while it is high, does not bother us much, as it makes a difference of only five per cent. above the price that has been paid all along. There is something else you must consider, viz., that selling prices of machine tools are based on the price at delivery, and not on present figures. Many of the best makers in the United States are sold out for four or five months to come, and by the time that has gone the exchange rate may have done much to right itself, so for the present there is no use of us worrying about it."

Should Plan Farther Ahead

Here's the opinion of one machine tool dealer, who has had a splendid chance to size up the situation as he finds it in the Canadian market: "Canadian manufacturers are fine fellows to do business with, but I am stating a plain and very apparent truth when I say that they do not plan far enough ahead. That is what is causing much of the congestion of orders at the present time. The average order that is placed in Canada looks like a piece of emergency business. You could almost imagine, at times, that the war was going to start all over again. It does not seem to be the practice to look ahead, make out their programme, and let the machinery dealers have a chance to get the business away to their principals in something like decent time."

The Small Tools

Some nice orders have been placed for supplies during the week. As stated last week, there is still some pretty close trimming being done in the matter of prices. One representative told CANADIAN MACHINERY this week that he had passed up a nice-sized order because he refused to meet a price that had been placed on the business. This same dealer was also of the opinion that the Canadian makers were holding their own in this market, despite other reports. Many of the dealers, outside of the special recognized representatives of the companies, are complaining of the lack of protection they receive from the makers. The makers of drills, etc., in Canada, sell at the same price to the trade as they will to the jobber. Dealers handling a number of lines feel that they must carry all these drills, etc., and in order to do so must make a profit on them. So, in some cases, they carry the lines, figure out their costs and selling price, and adhere to these figures regardless of what may or may not be done. They have to keep up their margin of profit, so they cannnot afford to cut prices in order to secure business, even on a large scale.

Like the machine tool business, the makers of drills, cutters, and similar lines are finding a demand for special equipment to do special work in the automobile field. So it is that firms have to make a special study of the shops with this view in mind.

Little in Scrap Market

Business is not making any new records in the scrap market just now. There seems to be a mysterious "something" in the scrap market these days that looks like some real happenings when it breaks, but there is also an air of mystery surrounding it that nothing has come out.

There is a very decided shortage of cast iron all over the country. It looks as though this shortage would become acute, as nothing is in sight at the moment to remedy the situation. The bulk of this kind of scrap usually comes from the breaking up of mills, factories, and the replacement of old machinery and equipment by new.

Conditions Are Worse

It looks from here as though the premium market would be in for a merry session in the spring, as far as the selling of steel is concerned. True, the United States Steel Corporation adhere to the schedule of March 21, but it must

POINTS IN WEEK'S MARKETING NOTES

Although the steel strike and the coal strike are both declared off, production at the steel mills in the United States will hardly be raised to anything like normal before the end of March.

—

U.S. authorities put a limit on the price of coke following a tendency to much higher prices due to the strike. The regulations may remain for some time yet.

—

It is estimated that the strike in the United States steel mills caused a loss in production of 2,600,000 tons.

—

U.S. railroads are counted on to come into the machine tool market for large supplies as soon as they are returned to their private owners by the U. S. Government officials.

—

Advances are reported in several lines of machine tools. Toronto dealers were notified of many ten per cent. advances. They contend that it does not hurt selling, although with exchange added it brings the price in Canada 50 per cent. above what the U.S. buyer pays.

—

Deliveries of steel are not improving. If there is any change in the situation it is for the worse rather than for the better.

—

Used machine tools are moving out very quickly owing to the fact that prompt delivery can be made, and there is also a big price difference.

—

There is an acute shortage of scrap iron just now, with no prospects of any relief. The coppers in the scrap line are dull and weak.

be remembered that the Corporation, large as it is, has a limit to its capacity, and also that none of the producers have much of a string on their material once it gets away from the mills.

Jobbers are trying to stock now for the spring rush, and they are finding that the work is hard and almost impossible. Any dealer that can get the ear of a mill just now, and secure a promise of a delivery at a date within reason at all, is lucky beyond words. Some of the rollers, according to reports, are not at all anxious to book up very far in advance, as they look for better business on ahead, and want to be in a position to get in on this when it comes.

Canadian mills are booked well in advance, so far, in fact, that there have been cases where orders for a very nice tonnage of sheets has gone begging for the reason that none of the mills cared to take it on. Booking is still going on at the Canadian mills, and they are making a very good performance in the matter of turning out the material.

NEW YORK MACHINE TOOL MARKET SHOWS A TENDENCY TO GO UPWARD

Special to CANADIAN MACHINERY.

NEW YORK, Dec. 18.—Not only has machine-tool business continued to hold up well, despite the restrictions put upon industry because of the coal situation, but the outlook for next year appears particularly encouraging. Many companies are known to be figuring on lists of tools to be bought early in 1920. The automotive industries bulk largely in present business and future prospects, but there are indications that next year the railroads will figure quite extensively in machine tool purchases. It is known that once the roads are returned to their owners, and a program of rehabilitation is inaugurated, large purchases of metal-working machinery will follow.

One of the interesting developments of the week is the issuance of a list of about 200 miscellaneous tools by the Wright Aeronautical Corporation, a new concern, which, in a measure, succeeds to the Wright-Martin Aircraft Corporation, though the assets of the latter were recently absorbed by the International Motor Co., of Plainfield, N. J. The Wright Aeronautical Corporation will build airplane engines, and possibly also Simplex automobiles. It will have a plant at New Brunswick, N.J., and possibly another one at Long Island City, N.Y.

Some Large Buyers

Other companies engaged in automotive lines are buying, or figuring on, extensive purchases. The Stevens-Duryea Co., Chicopee, Mass., has let a contract for a plant addition, and has already bought a few machine tools, with more purchases to come soon. Production of the Stevens-Duryea automobile will be resumed as soon as the plant can be tooled up. The Willys Corporation, Elizabeth, N.J., continues to place orders against its very large requirements, and the New Departure Mfg. Co., Bristol, Conn., a unit of the General Motors Corporation, has placed additional large orders in the past week. Several companies engaged in making lighting and starting systems, magnetos, spark plugs, etc., for automobiles, are figuring on buying tools early in 1920.

The American Locomotive Co., New York, is planning on the expenditure of several million dollars on plant expansion, and this will include some new work at the Montreal plant. New equipment, costing $500,000 or more, will also be purchased, some of the company's requirements now being before the trade for quotations.

The Farrel Foundry & Machine Co., Ansonia, Conn., which has purchased the Victory plant of the Fore River Shipbuilding Co. at Buffalo, has issued a list of about 70 tools, including large planers, boring mills, lathes, slotters, etc.

Prices on machine tools show an advancing tendency, some lines having been advanced from 5 to 10 per cent. within the past two weeks.

MAY BE MARCH BEFORE FULL PRODUCTION OF STEEL IS REACHED

Special to CANADIAN MACHINERY.

PITTSBURGH, Dec. 18.—An intense feeling of relief pervades the iron and steel industry. The coal strike is off, and probably carries with it what little was left of the iron and steel strike. What remains to be done is to complete the organization of working forces for efficient operations. Full output may not be reached until March, but steady progress is expected to be made. The steel trade feels as if it would be leaving behind it, with the old year, most of its troubles.

With one dissenting vote, the committee of the United Mine Workers, sitting at Indianapolis, on December 10, voted to accept President Wilson's proposal of 14 per cent. wage advance, any remaining grievances to be submitted to a commission of three to be appointed by the President and to report, if possible, within 60 days. Miners then began straggling back to work, and this week there is moderately-full operation of the union mines. Coal production by the non-union fields and a few union mines, had reached a rate about 50 per cent. of the rate in the four weeks ended Oct. 25, a period of very heavy production. Much coal was then being mined for stocking purposes, and thus there should be sufficient coal from now on, even though absolutely full operation at the union mines is not attained. Transportation will probably be the limiting factor. The railroads will make a special effort to expedite the production and movement of coal, but some of the commandeered coal had been moved far afield, and it will require some time to get all the empties back to their regular regions.

Most of the regulations as to the consumption of coal were removed by an order issued Dec. 12. They applied to the consumption of electric current in stores and office buildings. The regulation as to factories operating only three days a week was misunderstood in some quarters. It did not limit a factory that had coal, but prescribed that the distributing authorities would not furnish coal for more than a three-days' operation, and there was no guarantee that as much as that would be furnished.

Saturday, Dec. 13, the regulation as to consumption of coal in coke making was removed. As to beehive, the first restriction was 25 per cent., this being increased at the beginning of last week to 50 per cent.; but it required a little time to put the regulation into operation. Estimates are that last week's Connellsville coke production was 60 per cent. of that of the preceding week, which had shown a sharp increase over immediately preceding weeks, in the case of furnace ovens, but no increase in the case of merchant ovens. The by-product ovens were to be furnished no more than enough coal for a 50 per cent. operation, ovens being required to work on not less than 30 hours' coking time. This week the beehive ovens are operating as fully as labor conditions permit, while the by-product ovens will require some time to get into full operation again, as their coal must be shipped.

Pig Iron Production

Monday, Dec. 8, war-time price limits were placed on coke, these being $6 for furnace and $7 for foundry, in the case of Connellsville. Previously, there had been a scramble for spot lots, sending prices above $10. Some furnaces accumulated reserves, but a few had to bank; and this week a few more may have to bank, as it requires from one to two weeks for coke to reach destination. However, the restriction in pig iron production is not very serious. On the whole, the merchant furnaces have had to curtail more than the steel works furnaces.

The price limits will probably remain on coke until the end of the month

while coal price restrictions may last still longer. If the coke restriction were removed now there would be a wild market, through furnaces bidding against each other for spot lots, and furnaces claim that at such times some of the coke operators neglect their contract obligations to profit in the spot market, whereby some furnaces would simply be buying their own coke at a premium.

Steel Production

The coal strike can hardly have made steel scarcer, though there are no visible signs of it having made steel more plentiful. On the whole, the shortage of coal restricted the consumption of steel more than its production. A number of steel mills have been affected, but the finishing of steel has been restricted more than the production, through some works keeping their open-hearth furnaces, or Bessemer converters, going when they closed rolling departments to save coal, and the unfinished steel accumulated can be rolled later.

The Iron and Steel Strike

Before the coal strike began to restrict steel mill operations, the iron and steel strike was practically over, except in the Wheeling districts. Strikers in that district have been making investigations as to operations elsewhere, and find that the strike leaders grossly misled them by insisting that operations were poor in other districts. The Wheeling district strikers are, therefore, ready to go back to work, and plants in the district will be started as rapidly as fuel supplies permit.

While the strike is over, the steel producers explain that it will be some time before full production can be reached, as working forces are badly demoralized on account of so many men having shifted in employment, while the morale is low at some works through the men taking advantage of the knowledge that the employers preferred them to be on the payroll and doing indifferent work rather than to be on strike. The situation is probably not as bad as it is painted in some quarters, however, for it must be remembered that in August the production of steel, although greatly increased over the rate in May, was only about 80 per cent. of rated capacity, and in the first three weeks of September, just before the strike, it can hardly have been as much as 85 per cent. Thus the mills have no high mark to aim at in order to regain the rate of production before the strike.

It is now possible to make a fairly close estimate of the amount of steel production lost on account of the iron and steel strike. From its inception, September 22, until December 8, when the coal situation became altogether the dominant influence, there was a period of 11 weeks. The rate of finished rolled steel production just before the strike was about 600,000 gross tons a week; so that in the 11 weeks, normal production would be taken at 6,600,000 tons. Actual production may be estimated at about 4,000,000 tons, showing an apparent deficit of 2,600,000 tons. However, part of the production before the strike, perhaps 10 per cent. or more, was for the purpose of accumulating stocks, since the strike was expected, and in many quarters even a greater strike than occurred. Production for consumption was only between 500,000 and 550,000 tons, and stocks were drawn upon during the strike. The severest shortage was observed after the strike had been in progress eight or ten weeks, when production had greatly increased, because stocks were then largely exhausted. A 600,000-ton rate of production may not be reached before February or March, but if capacity operations are reached, the rate of production should be close to 725,000 tons a week. If labor shortage prevents full operation of steel mills, presumably the consumers of steel will likewise be affected by labor shortage.

Pig iron prices continue to show an advancing tendency, but only a slight one now, and possibly the buying movement is over.

SCOTIA CONTROLS ACADIA COMPANY

Purchase of Shares That Had Been Formerly Held by Belgian Interests

Halifax.—D. H. McDougall, president of the Nova Scotia Steel & Coal, is pleased with the results of the visit abroad of officials of that company. Prospects of export trade, especially in heavy forgings, axles and other finished products of the New Glasgow plants, were very encouraging, the Scotia company having formed most valuable connections in the British Isles and on the Continent.

In Belgium extensive and important business is now under negotiation, and the same may be said with regard to other European countries.

The high cost and scarcity of ships at the present time are delaying the closing sales of large quantities of ore that the Wabana mines are capable of producing, but the British and Continental steel manufacturers have a very high opinion of the quality of Scotia's iron ore and rapidly increasing and remunerative business in this direction will be finally closed when the shipping situation becomes clearer.

Gets Control of Acadia

On the other side the Scotia officials finalized the purchase of the Belgian interests of the Acadia Coal Company. This gives Scotia the control of very extensive and valuable coal areas in Pictou County which had been held in Belgium since 1910. The acquisition of these properties by the Scotia company means the rounding off of Scotia's holdings on the mainland, and in addition to greatly adding to the scale of the company's present operations it will eventually result in a much greater development of the properties of the two companies. Asked as to the rumors of the merger of the steel companies of Eastern Canada, Mr. McDougall said there was absolutely no change in this respect as far as Scotia was concerned. The company's connections on the other side, together with its already established business in Canada, places Scotia in a position to carry on very satisfactorily on its own account.

RAILROADS MAKE USE OF MOVIE BUSINESS

Teach Safety Ideas by Entertaining Methods—December Session of Railway Club

The advantages of motion pictures as an industrial educator were amply illustrated at the December meeting of the Canadian Railway Club, held in the Windsor Hotel, Montreal. One of the pictures shown was on "The House That Jack Built," the film used by the "Safety First" department of Canadian National Railways for the instruction of the employees in guarding against possible accidents incidental to the daily life of the railroad worker. Before the picture was thrown on the screen a preliminary talk was given by E. E. Stevens, of Moncton, N.B., safety engineer of the C.N.R.

The second picture depicted was what might be termed "Safety Second Movement" of industrial warfare. This film consisted of two reels taken by the St. John's Ambulance Association, for demonstrating in a pleasing and instructive manner the proper methods of treating a variety of injuries sustained by persons in the course of their daily domestic or industrial duties. The work of the St. John's Ambulance Association has been invaluable in the saving of life and limb, and a brief history of the origin and development of this universal first aid work was given in a very comprehensive talk by Col. R. J. Birdwhistle.

It was decided at the meeting that the annual dinner of the Canadian Railway Club would be held again this year, and a committee has been formed to arrange the necessary details for a banquet, which will take place about the end of January.

John Stewart, of Paris, Ont., died at Brantford recently. He was a resident of Paris for forty years and conducted a foundry in that city. He was born at Galt and has been living in Paris during the last four years following a stroke which incapacitated him. He is survived by three daughters.

Civil Service Appointments.—The following appointments are announced by the Civil Service Commission: Commander Bernard Leitch Johnson, D.S.O., Vancouver, to be superintendent of pilots for B.C., with headquarters at Victoria. John Milford Wyatt, juvenile employment specialist for the Department of Labor; Ralph Hoppimh, San Francisco, entomologist for the Department of Agriculture for B.C.

GEOMETRIC

Adjustable Collapsing Taps

Have overcome all the expense and annoyance of tapping screw threads with a solid tap.

Anyone doing thread tapping knows what backing out a solid tap each time means. It usually means low production, poor threads, and worn out taps.

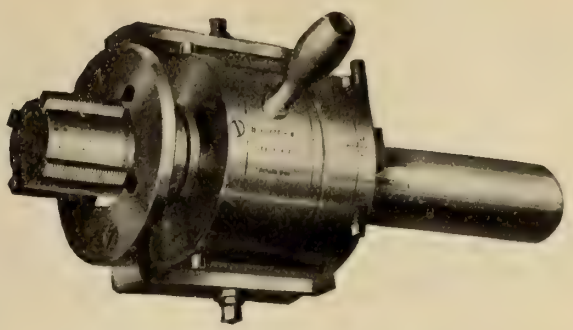
The mechanism of the Geometric Taps takes care of adjustment to correct diameter each time a thread is tapped, it collapses the chasers automatically, leaving a thread clean cut and perfect.

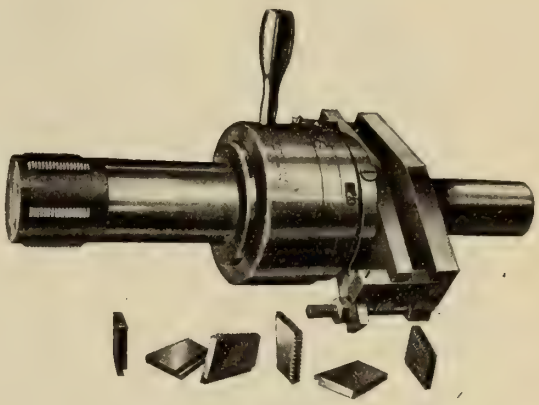
The chasers are readily reground, and when finally used up, are renewed at comparatively small cost, leaving the tap as efficient as when new.

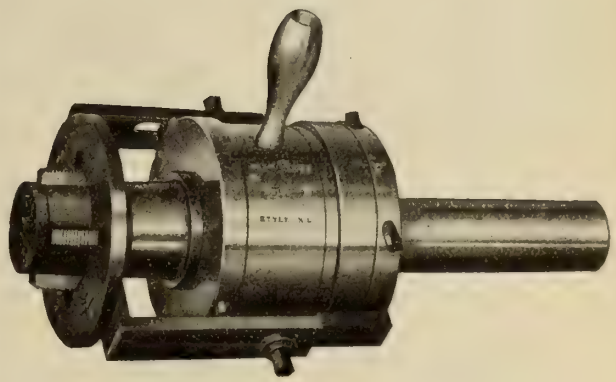
The manufacturers of the Geometric line of Collapsing Taps and Self-opening Die Heads are justly proud of the distinction which is theirs:—

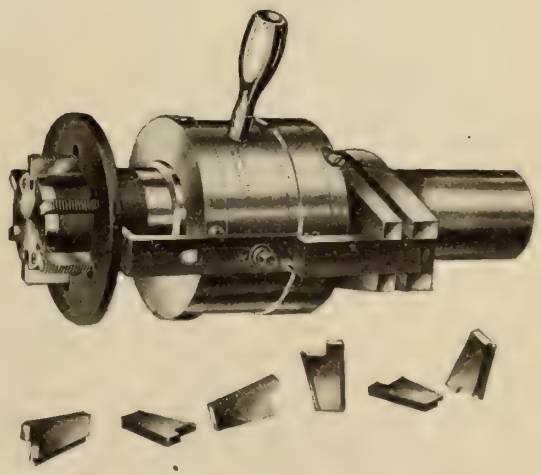
The Originators
and the
Largest and Best Known Manufacturers
of
Automatic Threading Tools

For cutting all classes of screw threads, internal and external, of any diameter and form.









The Geometric Tool Company

New Haven, Conn., U.S.A.

CANADIAN AGENTS:

Williams & Wilson, Ltd., Montreal; The A. R. Williams Machinery Co., Ltd., Toronto, Winnipeg and St. John, N.B.; Canadian Fairbanks-Morse Co., Ltd., Manitoba, Saskatchewan, Alberta.

MONTREAL NOTES

Lawrence Russell, vice-president and general manager of Armstrong, Whitworth of Canada, is on his way home from England, after a two months' business trip in the interests of the firm.

—

Following a recent address by T. B. Macaulay, before the Montreal Board of Trade, on the question of closer trade relationship between Canada and the West Indies, a special committee has been appointed to study the possibilities of this trade development.

—

The McClary Manufacturing Company will shortly erect a considerable addition to their Montreal plant, and have acquired an adjoining property for this purpose. It was stated by J. C. Newman, Montreal manager of the company, that the new building will be one of four storeys, and that construction operations will be commenced immediately.

—

Plans are progressing for the construction of a large modern equipped foundry at Lachine for the Dominion Bridge Co. This departure was found necessary, owing to the post-war developments of the company in regard to the manufacture of turbo machinery and paper mill equipment.

—

Owing to the pronounced scarcity of coal, the Canadian Trade Commission has taken steps to regulate the distribution of existing supplies, on a preferential basis. In connection with the bunkering of boats at Canadian ports, vessels under the Canadian flag will receive the first consideration. Generally speaking boats applying for coal will only be supplied with sufficient to reach their destination. It is recommended that, as far as possible, bunkering will be carried out at Sydney on account of proximity to the mines.

—

The closing of the port of Montreal for the winter season has transferred the shipping activities to St. John, N.B., and this latter terminal will take care of the bulk of the imports and exports of Canadian trade. In view of the growing importance of the city of St. John it has been proposed that better hotel accommodation should be furnished and to this end plans have already been prepared, and the committee in charge have recommended a structure of about 200 rooms at an estimated cost of approximately $900,000, of which $700,000 has already been raised.

Windsor.—During the operation of salving the Willis L. King, the chief officer, John T. Lillis, was killed, and James Dawson, foreman of the Great Lakes Engineering Works, Ecorse, was painfully injured. The accident was caused by the wire cable breaking away from the snatch block, while the tug was pulling on it in an effort to release the steamer from the bank.

U.S. SCRAP METAL

The pig iron market is still advancing, but is steadier than has been the case of late. In some districts, uncertainty over the coal situation has affected the market. Following are reports from various sources:—

PITTSBURGH—There has been a general advance of $1 per ton on the base grades of pig iron. Basic is selling at $34. The market is not so much on edge as it has been, but demand is good. Producers are not anxious to take much business at current prices. There is still a lot of 1920 business to close, and prices are expected to improve still more.

BOSTON.—Iron is scarce, both for prompt delivery and first half, and prices are mounting. A Massachusetts melter has bought from Eastern Pennsylvania furnace No. 2X at $37 furnace, prompt shipment. 400 tons of $3.25 to $3.75 silicon was bought for $41 Virginia furnace. Price is secondary consideration in the present state of the market.

NEW YORK.—A good deal of iron has been picked up quietly, and is being held for a rise. Basic has moved during the week at $35 Eastern Pennsylvania furnace. A Central Pennsylvania furnace is quoting $39 furnace on 1.75 to 2.25 silicon. There is not much iron available at furnaces.

Trade Notes

Restrictions on Gas Users.—The Government Gas Commissioner at Chatham has issued an order prohibiting any industry using natural gas for special manufacturing or commercial purposes without first obtaining a permit from the local gas company.

Sudbury Wants Aerodrome.—The Sudbury Board of Trade have decided to invite a representative of the Bishop-Barker Aeroplane Company to visit the city in connection with the establishment of an aerodrome for the trans-country service the company have in prospect.

Brantford Factory Has Large Output.—The Dominion Steel Products Company of Brantford turned out a total of 800,000 tons of propeller shafting during the war. This was twice as much as Canada's total tonnage for the year of 1918. One shaft was built for the United States destroyer Reid.

Coal Embargo Still On.—The restriction on coal which have been removed in the United States are still in force in Caanda. The embargo on coal coming across the border is still in force. This was announced following a meeting of the Dominion and Provincial fuel controllers, subsequent to the settling of the U.S. coal strike. There is still the danger of a serious car shortage developing, which would be as bad in its way as the non-production of coal at the mines.

PIG IRON TRADE

The market for old material is firm. In most districts demand is good, with rising prices in some cases. Following are reports from U.S. points:—

PHILADELPHIA. — There is a fair demand for most grades of scrap, and the tendency is for prices to advance. The fuel situation is acting as a check but should be discounted by now. Heavy melting is quoted at $25, delivered.

BOSTON.—All grades are in demand and selling higher. No. 1 machinery has sold at $36, and heavy melting at $18. 400 tons of No. 1 cast was sold at $34.50. Heavy cast brings $28 to $28.50.

NEW YORK.—The general trend of prices is upwards, in spite of one or two exceptions. Cast borings have dropped $1, now quoted $16.50 to $17 f.o.b. New York. Heavy melting is now $18.50 to $19 f.o.b. New York, an advance of 50 cents. Machinery cast has gone up $2, and is now $27 to $28 f.o.b. New York.

PITTSBURGH—The market is strong. Dealers are not inclined to make any sacrifices, on account of the threatened curtailment by the mills. Heavy melting is at $25, delivered. Other grades are strong, except bundled and baled sheets.

INCORPORATIONS

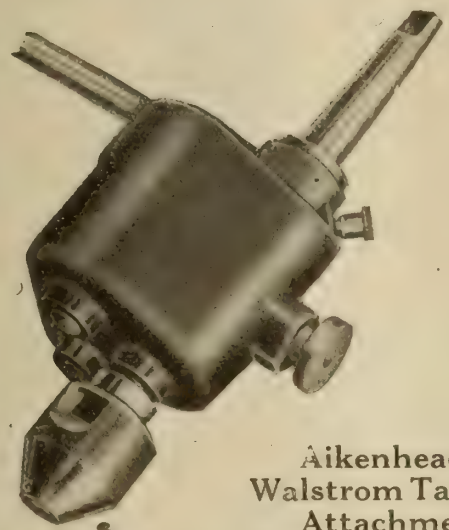
The Dominion Engineering & Machinery Company, Ltd., with a capital stock of $3,000,000, and with head offices at Montreal, heads the list of incorporations in this week's "Canada Gazette." Other companies are: United Amusements, Ltd., Montreal, $1,000,000; Peterborough Paper Box Company, Peterborough, $50,000; Super-Cement (America) Co., Ltd., Toronto, $500,000; Manatee Lands, Ltd., Montreal, $150,000; Scientific Experimenter, Ltd., Montreal, $100,000; Olswang Leather Specialty Co. of Canada, Ltd., Montreal, $20,000; Canada Drugs, Ltd., Yorkton, Sask., $50,000; Winans, Dickinson & Whitehead, Ltd., Montreal, $200,000.

Kingston.—The barge Cadorus, owned by the Sincennes-McNaughton line, sank in lock 21 of the Morrisburg Canal. The stern section of the Great Lakes liner Northland is blocked, owing to the accident. The Sincennes McNaughton Company will commence wrecking operations at once.

Montreal.—Plans for the harbor works at Vancouver have been authorized, and Mr. A. D. Swan, consulting engineer, has been instructed to proceed immediately with the work. The work will cost $5,000,000, and tenders will be called for within six or eight weeks. The Vancouver Harbor Commissioners have been studying harbor facilities at Montreal, Quebec and New York.

Aikenhead's Tools

Dependable in Quality and Service



Aikenhead's Walstrom Tapping Attachment

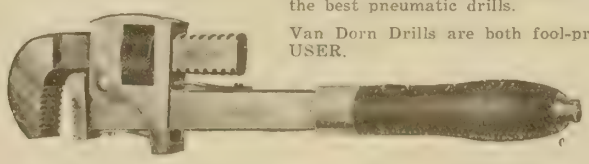
The oscillating movement mechanically imitates hand-tapping, though 10 times faster, and reduces tap breakage to the very minimum.

Attached to any drill press will quickly pay its cost.

Aikenhead's VanDorn Electric Portable Drills

Van Dorn Electric Drills make neat, clean holes 50% faster than the best pneumatic drills.

Van Dorn Drills are both fool-proof and trouble-proof. ASK THE USER.



Aikenhead's Stillson Wrench

The best of its kind always grips when wanted. A dependable friend for all types of pipe work.

Aikenhead's Walstrom Chuck

Grips the tool by the entire shank.

The cam action is such that the resistance on the tool governs the holding power of the jaws. **Slippage is impossible.**

Aikenhead's Bull-Dog Die Stocks

No keys—no collets—and tool changes made in two seconds without stopping spindle. No small parts to lose or get out of order nothing to break in use. No leader screw, making it possible to furnish with dies for a longer range of sizes.

Write for full particulars and prices re any line or lines in which you are interested.

INDUSTRIAL NEWS

NEW SHOPS, TENDERS AND CONTRACTS PERSONAL AND TRADE NOTES

PECKOVER'S, LIMITED, TO ERECT BIG WAREHOUSE AT FOOT OF SPADINA AVE.

ANNOUNCEMENT is made of the formation of a new warehousing, jobbing and importing company in Toronto under the name of Peckover's, Limited. Work is being rushed on tem-

J. G. NEAR,
General Manager, Peckover's Ltd.

porary premises at the foot of Market street, the firm's address being for the present 67 Esplanade. They have been fortunate in mill deliveries, for already over a thousand tons are on the way in the line of bars, steel and iron, alloys, nickel steel, tool steel, sheets, plates, galvanized, tubes, etc.

The new premises, which will be ready as soon as possible in 1920, give Peckover's, Limited, a splendid site of three acres at the foot of Spadina Ave. at the corner of Fleet street. Besides a splendid dock, they are on three lines, the C.P.R., G.T.R., and C.N.R. In this way they can get water delivery from Algoma, Hamilton, or the mills in Nova Scotia, and are close to the rails for quick shipment.

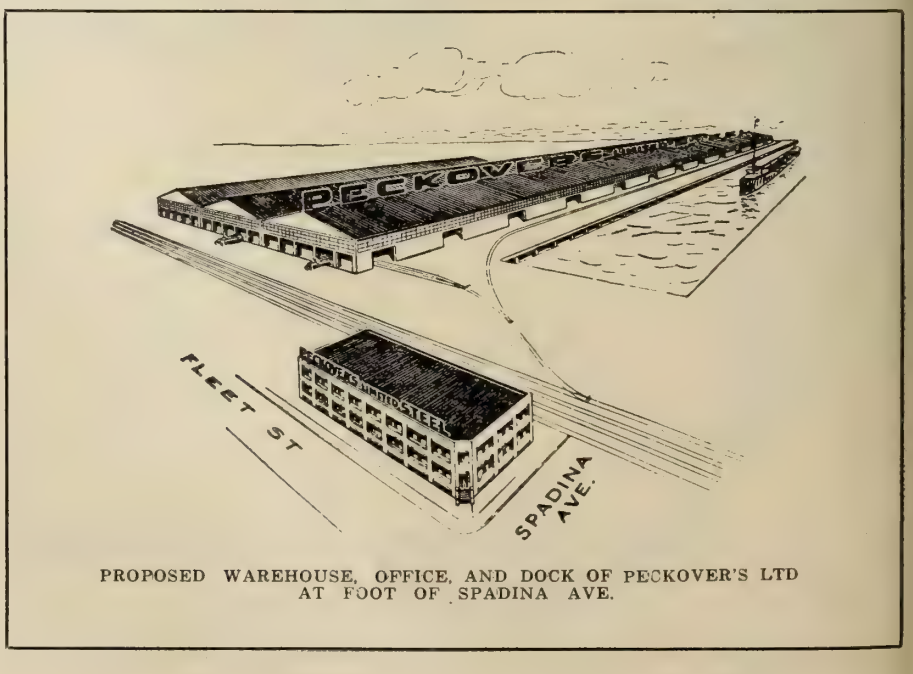
The principals in the new company are C. R. Peckover, of the firm Baines & Peckover, and J. G. Near, for the past 18 years with the Drummond-McCall Co., of Montreal and Toronto.

Mr. C. R. Peckover has been in the steel business in Canada for a long time. He first started at the study of steel in Scranton, coming to Canada about 23 years ago to the Rice Lewis Co., but remaining with them for only a year. It was then that he went into business with Mr. Baines as agents for the London Rolling Mills and for the London Bolt and Hinge Works. The firm of Baines & Peckover developed to large proportions, Mr. Peckover enjoying the confidence of a large clientele on account of his intimate knowledge of the steel business. Mr. Peckover has been a traveller as well as a successful steel merchant, but his travelling has very often had a touch of business. For instance, he has visited nearly all the large steel mills of America and Europe, and also most of the best conducted warehouses, looking for information and ideas.

J. G. Near is a Toronto boy, going from school to the Drummond-McCall business some 18 years ago. Mr. Near had much to do with the development of the Drummond-McCall warehouse department, having charge of that work for some years, and latterly in charge of all sales. He is well known to the industrial interests of Ontario particularly. A few years ago Mr. Near was better known as a runner, winning the Ward Marathon in Toronto (20 miles) in 1909. He also ran well up toward the front in the Boston Marathon, and was third man when the Hamilton Herald road-race was bringing out a string of contestants from all over the country each year. Mr. Near becomes the general manager and secretary of Peckover's, Limited.

The new warehouse at the Spadina avenue property will be a model one in every particular, with overhead electric crane installations for moving material. The main building will be 200 feet wide by 600 feet long, while the offices of the company will be across the tracks, on Fleet street. Several changes will be made from the ordinary warehousing practices in Canada. Sheared plate is bought now in practically every case, but Peckover's, Limited, will cut to any size desired, in plate, shapes and structurals. Plate also will advance six inches at a time, instead of a foot, which is now the general practice.

As far as CANADIAN MACHINERY can learn, Peckover's, Limited, was brought into existence at this particular time on account of a fairly well-founded rumor that a large American concern was coming in here to conduct a waterfront warehouse on similar lines. The new firm is capitalized at half a million dollars, with $300,000 paid-up capital.



PROPOSED WAREHOUSE, OFFICE, AND DOCK OF PECKOVER'S LTD AT FOOT OF SPADINA AVE.

will get the attention of the busy men. They find grouped here a big list of equipment for immediate shipment, and they use it as a catalogue when they need any. Will they see your list?

TRADE GOSSIP

Brantford Cordage Will Rebuild.—The brick warehouse of the Brantford Cordage Company, which was blown down by the recent severe windstorm, will be rebuilt immediately. The new building will be steel and brick, and the P. H. Secord Construction Company have the contract. Work has already been commenced.

New Toronto Factories.—There are some big new buildings projected in connection with Toronto's industries. The Willard Chocolate Company are going to erect a large factory on the corner of Manning Avenue and Dupont Street, for manufacturing ice cream, the cost to be about $140,000. The Ward Baking Company, of New York, will erect a bakery on the north-west corner of the same streets, and on the north side of Dupont Street the Kinnear Wholesale Grocery Company will erect a $150,000 warehouse.

Hope for Settlement Soon. — The conciliation board enquiring into the Nova Scotia coal strike, held its first sitting recently, and following it, an official of the U.M.W. stated that there were good hopes of an early settlement. Mr. H. J. McCann, assistant to Mr. Mark Workman, signified his willingness to meet the men's representatives, and the latter said in reply that they had always been anxious to discuss their differences, and would be pleased to accept the offer of a further conference.

Fuel for Foundries. — According to Mr. Harrington the 150 cars of soft coal that have been held at the U.S. border have been ordered released by the Federal authorities. There is, therefore, no further fear that Canadian foundries will have to close down for lack of coal. Coke will, likewise, be allowed to come freely into Canada. Mr. Harrington also said that unless the utmost conservation was observed in office and large buildings, he would be forced to issue an order limiting the temperature, and enforce heatless days.

Going to Sarnia?—Lake Huron Steel Corporation plans are now centred in Sarnia, according to latest reports from that centre, and a deal is understood to be in process of completion for the acquiring of 1,184 acres along the St. Clair River front from the Sarnia Indians for $200,000. The property in question adjoins the tract purchased some time ago by the Wills Lee Automobile Corporation of Sarnia and Port Huron. It is the purpose of the Steel Company officials to proceed with the erection of a $15,000,000 plant in March. The persons whose names have been associated with the enterprise are S. A. Howland, Detroit banker, and J. J. Mahon of the Imperial Munitions Board. Several other men prominent in Canadian and American industry are stated to be connected with the company. The Chamber of Commerce and City Council of Sarnia are meeting the officials of the Steel Company to negotiate on the matter of concessions.

CHANGES MADE IN INGERSOLL FIRM

Ingersoll.—An important announcement pertaining to changes affecting several local industries has been made. It is of special interest to citizens in view of the fact that the annual payroll is one million dollars, which will necessarily be a big factor in continuing the substantial progress which this town has been making.

E. A. Wilson of the Ingersoll Machine Co., Ltd., has joined with the John Morrow Screw & Nut Co., Ltd., and will be vice-president and joint manager with J. A. Coulter, the head of the Morrow Co. for many years. It also has been announced that the Morrow Co. has purchased an interest in the Ingersoll Machine Co., Ltd., and the American Machine Products Co., Incorporated, of Detroit, and will, with Mr. Wilson and Mr. Munger, formerly of this town, operate them, together with the Ingersoll File Co., as subsidiary companies to the John Morrow Screw & Nut Co., Ltd.

At the plant of the Ingersoll Machine Co. some $50,000 worth of new machinery is being installed to make a line of tools not previously made here.

Col. F. H. Deacon, of Toronto, honorary president and director of the board, will devote as much time as possible to the development of the industries here.

MARINE

Kingston—The Canadian Beaver was launched from the yard of the Collingwood Shipbuilding Company at Kingston, being christened by Mrs. J. B. Foote, wife of Capt. J. B. Foote, of Toronto. The vessel is a full canal-sized freighter for the Canadian Government Merchant Marine. She is 251 feet long, and of 3,500 tons deadweight.

The Chairman of the Board of Control, Toronto, will receive tenders up till February 10th, 1920, for the supply and installation of one or more 16 to 20 million imperial gallon centrifugal pumps at the waterworks main pumping station. Specifications and forms of tender can be obtained at the Works Department, Room 12, City Hall.

Hamilton.—The steamer "Floretta," which was the first boat to steam through Hamilton harbor at the opening of navigation this season, has been refloated from the shoals of Kelly Harbor. She was stranded there through the receding of the water caused by the heavy wind of a few days ago. She has been in continuous service all season, and has steamed a total of 2,360 miles.

Halifax.—The "Royal George," fitted with an amplifier on her wireless apparatus of the same type that has been heretofore only supplied to warships, has broken a record for wireless telegraphy on merchant ships. She received a message from England when only a few miles off Halifax, this being the first time a merchant vessel has received a message clear across the Atlantic. The "Royal George" is the first merchant vessel to be fitted with an amplifier.

Montreal.—The Elder-Dempster liner "Bassa," which went ashore while clearing harbor on her voyage to South Africa, has been successfully refloated. She was taken into Vickers' floating dry dock for examination and repair, if found necessary. Before she could be floated it was necessary to lighten her of a large part of her cargo, and required the united efforts of a harbor tug and the Government steamer "Strathcona" to dislodge her.

Montreal.—Admiral Jellicoe does not believe that surface ships will be entirely supplanted by submarine and aerial types in the near future. Speaking before the Canadian Club in Montreal, he said he had every respect for the enthusiasm of aircraft and submarine officers, and no doubt it was very tempting to those who held the purse-strings to say "Let's spend no more on the navy." He thought the fact of the Admiralty being about to sell the "Indomitable" was because she was out-of-date.

London.—Owing to the frequency of losses due to floating mines the marine underwriters have been compelled to raise their rates. The rate is now about one-half of one per cent., against one-eighth of one per cent. a few weeks ago. The rates were dropped after a rather long period in which losses were low, but they have been gradually increasing. After the Russo-Japanese war, losses from mines were encountered as long as eighteen months from the conclusion of hostilities.

NEW CATALOGUE

The Clark Equipment Co., Buchanan, Mich., have issued a very attractive catalogue illustrating their well-known line of Celfor drills, reamers, lathe tools, etc. Their complete line is described in this useful book. A general information section is placed at the back, containing telegraph codes, feeds and speeds, morse taper shanks, decimal equivalents, and other useful data. This is known as their catalogue No. 17.

TOOL HOLDER CATALOGUE

A catalogue of unusual style has reached us from Jones & Shipman, Leicester, England. This booklet illustrates various style tool holders, both English and American design, but shows, in almost natural color, the finish on these holders. Lathe dogs, sockets, tool drifts, and centre drills, gauges and chucks, are also included in the catalogue.

LOOSE LEAF CATALOGUE

The Smith & Mills Co., of Cincinnati, Ohio, have recently issued an attractive loose leaf catalogue on their lines of pillar shapers, showing various size machines, also attachments for the same. Shaper vises are also included in this catalogue.

Increased Capitalization

The business of the Smalley General Company has grown so rapidly that a larger capitalization has become necessary to increase its plant and other facilities.

The Smalley General Company has increased its capital from $50,000 to $525,000, all of which is paid up. It has no bonded, mortgage or other funded indebtedness. It has no floating indebtedness save current accounts. It will discount its bills.

The management and officers of the Company remain the same. The new stockholders are: Messrs. John W. Eddy, of the Skinner-Eddy Corporation, Seattle, Washington; James G. Eddy, of the Ferry-Baker Lumber Company, Everett, Washington; R. B. Eddy, of the Eddy Investment Company, Bay City, Michigan; Howard F. Smith, of the Michigan Pipe Company, Bay City, Michigan, and Dominion Sugar Company, Chatham, Ontario, and J. R. Decker, Sales Manager of the Smalley General Company.

This increased capitalization will place the Company in an excellent position to promote the development of Thread Milling, to increase its production and to serve its customers.

WHEN ANSWERING ADVERTISEMENTS KINDLY MENTION NAME OF THIS PAPER

Long Lived

Because It's Made of Robertson Process Metal

Few parts of your buildings are subjected to the severe conditions that ventilators must face. With smoke, acid, alkali fumes and gases coming through them; and snow, sleet, and wind battering away at them on the outside it is no wonder that ordinary ventilators crumble away and cost so much for repairs.

This different kind of ventilator—the Robertson Ventilator, is *totally different* from other ventilators for two reasons.

First—It's made of Robertson Process Metal—a material that does not need painting and does not corrode. It is not affected by acids, fumes and gases.

The underlying reason for this great durability is the three impervious coatings which serve as true protection. First, asphalt; second, asbestos; third, water-proofing. The metal is fully protected first and then built into Robertson Process Ventilators.

Second—It is a matter of design—a design which develops more "air-pulling" capacity than any other ventilator of equal diameter. The Robertson Ventilator is a stationary type. It therefore requires no oiling or cleaning and does not get out of order. By the use of projecting wings, two sets of tapering air channels and frustum cone hood with extra large outlets, this ventilator puts to work every air-current regardless of its direction. It does its work under the most adverse conditions—low or high wind velocity.

Robertson Ventilators are built in standard sizes with stack diameters from 8 inches to 72 inches. Robertson Engineers have made a special study of ventilation problems and their services are available without obligation. Send for special ventilator booklet or general booklet Robertson Process-Metal Gypsum, Asphalt.

WHEN WRITING TO ADVERTISERS, KINDLY MENTION THIS PAPER

THE "WANT" AD.

The "want ad." has grown from a little used force in business life into one of the great necessities of the present day.

Business men nowadays turn to the "want ad." as a matter of course for a hundred small services.

The "want ad." gets work for workers and workers for work.

It gets clerks for employers and finds employers for clerks. It brings together buyer and seller, and enables them to do business though they may be thousands of miles apart.

The "want ad." is the great force in the small affairs and incidents of daily life.

C. G. E.
Fractional H.P. Motors

Every manufacturer who markets a motor-driven article should take into consideration that if the motor fails to give satisfaction, the whole machine will be condemned.

It is therefore obvious that the utmost care must be exercised in choosing the type of motor that will give maximum satisfaction with minimum attention, relative to the particular requirements of your product.

The C.G.E. Fractional H.P. Motor is a power unit that has stood the test of time. It is giving universal satisfaction in scores of different types of motor-driven appliances — from the Vacuum Cleaner and Washing Machine for the housewife, the Meat Cutter and Coffee Grinder for the butcher and grocer, to the Adding Machine and small Printing Press for the office.

Let us assist you in selecting or building the right motor under one h.p. to operate the machine you are now or contemplate making.

Take No Chances

You Can't Afford to Spoil Material or Risk Tool Breakages.

MODERN industrial plants invest too much in costly material and high-priced labor to risk spoiled work or expensive breakages of machine parts or tools. Many tool breakages are directly due to improper hardening. It is often almost impossible to replace at once special tools or parts, making necessary the holding up of a machine and the entire progress of production.

Stewart Furnaces for proper industrial heat treatment are absolutely dependable in production results. No spoiled material—no imperfectly hardened tools or machine parts. You can trust your most exacting work to a Stewart and *know* that it will meet the requirements.

Stewart Furnaces are *built right*. Thorough knowledge of metallurgy and modern shop practice means practical, scientific design. High grade materials, skilled workmen, and efficient supervision make for sturdy, dependable construction that will stand up day after day. Convenient, economic fuel consumption, with just the right placement of heat, and temperature always under positive control, result in uniform, high quality production.

We will help you solve your heat treating problems. Our new catalog, No. 75, is yours for the asking.

Why use makeshifts?

WHY waste time and energy with makeshift devices for boring operations when Williams' "Agrippa" Adjustable Boring-Tool Posts offer convenience and efficiency developed to the nth power?

Each post accommodates a wide range of Bars, the height of which is readily adjusted; a turn of the Knurled Ring raises or lowers the base on which they rest. The whole device is instantly and rigidly locked by tightening the Set Screw.

Four sizes for ½ to 2¼" diameter Bars—furnished with or without Bars.

Ask for Machinists' Tools Booklet.

Use Common Sense

Real Hack Saw Economy requires the use of common sense in the regulation of weight on the saw.

Every machinist knows, when he is using a hand hack saw, that as the blade becomes worn, more pressure must be put upon it if the cutting speed is to be maintained, but he's very apt to overlook that point in using power machines.

As the saw is used the teeth become worn, and what we call the "contact" area, the area of the blade that actually rests on the work, becomes greater. That means friction and a necessity for more pressure to make the blunted teeth cut into the work. On a heavy saw 64 pounds pressure is generally about the right figure to start with, but to keep the saw cutting as fast, after it has made twenty odd cuts as it did at first, more pressure-weight is needed.

The Starrett Hack Saw Chart "3" helps every user of Hack Saws to do more work at a lower cost. Copy sent you free upon request. Write for Catalog No. 21 "3"

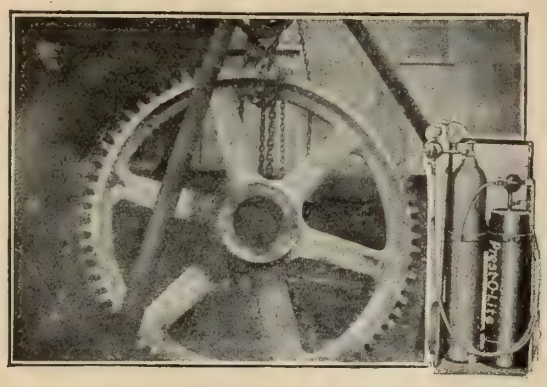
Oxy-Acetylene Welding and Cutting



This Expensive Gear Wheel Reclaimed at Trifling Cost

This Gear Wheel, in a large plant at St. Catharines, was broken recently. To replace it would have taken much valuable time and represented quite a serious expense.

A local Prest-O-Lite operator was called in and undertook to repair the casting in record time at trifling cost.

The work was done by the job welding department of the International Garage, St. Catharines, Ont., and has given complete satisfaction.

Prest-O-Lite Oxy-Acetylene Welding is proving a great economic factor in the Factories, Mills, Railroads, Mines and Machine Shops of Canada.

Prest-O-Lite PROCESS

employs both gases (acetylene and oxygen) in portable cylinders. Prest-O-Lite Dissolved Acetylene is backed by Prest-O-Lite Service, which insures prompt exchange of full cylinders for empty ones; provides dry, purified gas, insuring better welds, quicker work and lower operating cost.

Apparatus consists of an equal pressure blow pipe, automatic regulators and gauges, and all necessary equipment. Adaptable for oxy-acetylene cutting by an addition of special cutting blow pipe.

Thorough instructions are furnished free to every user of Prest-O-Lite Dissolved Acetylene. Any average workman who understands metals can learn the welding process quickly and easily.

We will gladly send illustrated literature and interesting data showing actual instances of savings made by others. It may suggest valuable ideas to you. Write for it.

Address Department C-107.

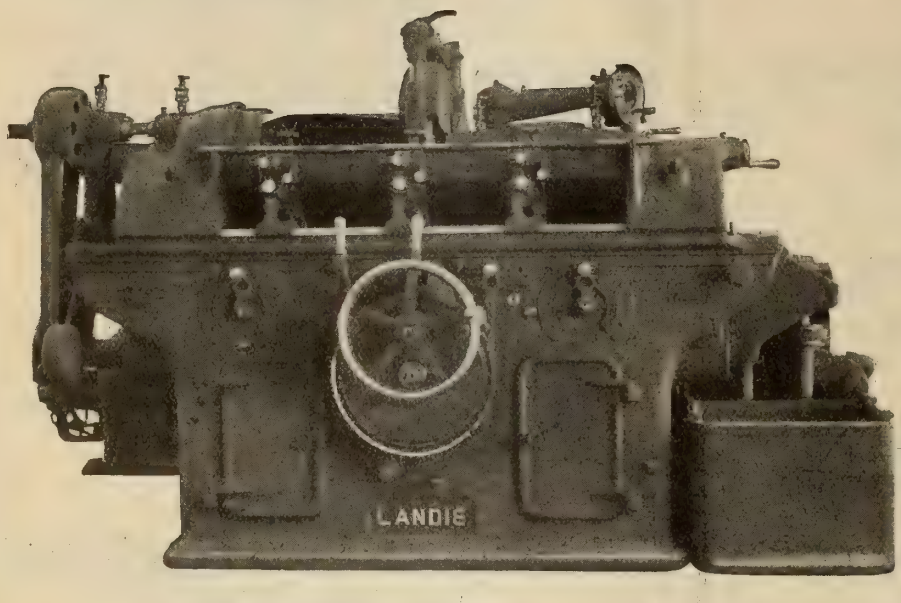
LANDIS

Accuracy---
A LANDIS Attribute



No matter how excessive the tool-load may be, there can be no variation of the degree of accuracy because the work is held stationary —and "the wheel travels."

In addition the Landis is compactly and rigidly built to avoid any chatter.

A study of the machine will convince you of its many advantages and its fool-proofness. The built - in, labor-saving features insure big production.

Let us send you our catalog.

CLINTON CEMENT

Did You Ever See Two Postage Stamps Stuck Back to Back?

Well, that's the way two bricks stick together when our cement is used.

The greatest loss in your furnace efficiency occurs as the result of leakage, cold air pouring in and interfering with proper combustion.

We Have Got This Licked!

Fireclay dries up and sifts out from between the bricks like powder.

But our cement sets and makes a surface like glass yet allowing for expansion and contraction. It sets hot or cold and stands a heat up to 3,000 degrees Fahrenheit.

This cement makes a joint that is stronger than the bricks themselves, and that is itself the strongest part of the whole furnace.

A five-pound tin of **Clinton Super-Heat Cement** will be sent to you free and all charges prepaid, if you write the

One Cuts Up
Another Cuts Down
and
They Both Cut
At Once

Hurlbut,
Rogers
Cutting-off
and Centering
Machine

Here's Real Economy

This patented Hurlbut, Rogers Cutting-Off and Centering Machine embodies two cutting-off tools—one cutting up and the other cutting down, each holding the work against the other. What is the result?—**the production is doubled and the cost is cut in half.** Further, the centering operation goes on at the same time. Doesn't this appeal to you as real economy in production? When you are assured of such good-paying results why hesitate to adopt this machine? Soon pays for itself.

Let us hear from you and we will give you the full story of its ability.

The Hurlbut, Rogers Machine Company
South Sudbury Mass.

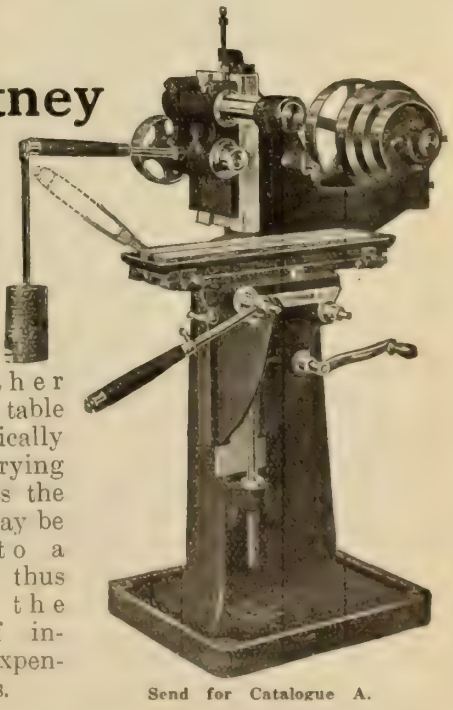
Foreign Agents — England: Chas. Churchill & Co., Limited, London, Manchester, Glasgow, Newcastle-on-Tyne.

Thousands in Use

The Whitney

Hand Milling Machine

The Weight Attachment



feeds either head or table automatically and by varying the weights the pressure may be adjusted to a nicety, thus avoiding the danger of injury to expensive cutters.

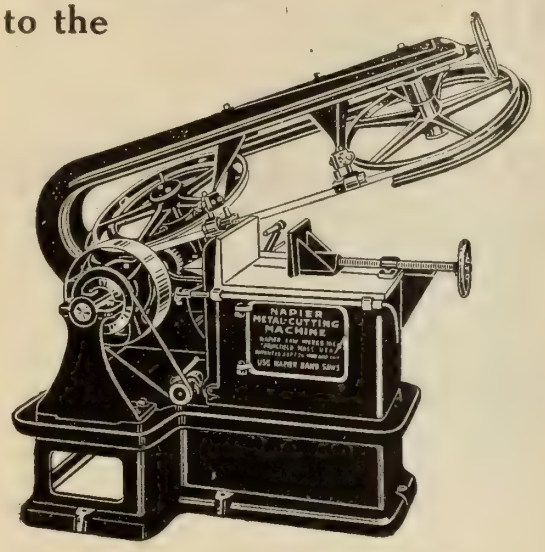
Continuous Cutting

gives more than a two-to-one advantage to the



NAPIER

Metal-Cutting Machine

Compare the swift, smooth, steady, **continuous** cut of the NAPIER with the hacking-back-and-forth, half-the-way cut of the best power hack-saw, and you'll see at once what the NAPIER can do for you.

Every tooth of the NAPIER band saw does its full share of cutting, and is not prematurely dulled by useless back strokes. There is no jerking or vibration to shorten its life.

Cutting without vibration, the thin NAPIER blade removes a kerf not over .049"—a decided saving of metal and power.

But the big advantage of the NAPIER Metal-cutting Machine in most shops lies in its **speed.** The NAPIER will do more and better cutting for you than any three power hack-saws that are or can be made! It cuts any size up to 10"x10", round or square —takes only 4'x6' of room—and weighs 1550 pounds. Belt or motor drive.

Shall we send you our illustrated NAPIER Booklet?

Napier Hack-Saws Blades get the best out of any hack-saw. Have you tried them?

Are You Open to Conviction?—Then Let Us Tell You Why

THE "RACINE"

Will Greatly Reduce Your Metal Cutting Costs

No matter what machine you may be using for your metal cutting operations, it will pay you to install the "RACINE" This is no exaggeration, but a fact. The "Racine" is superior to all others because:

It has a patented automatic blade lifting device.

This patented feature prevents all dragging and strain on the non-cutting stroke.

It permits faster cutting and greater production.

It gives a longer life to the blade.

It uses up less power.

Don't you think you could use the "RACINE" to good advantage?

Standard the World Over

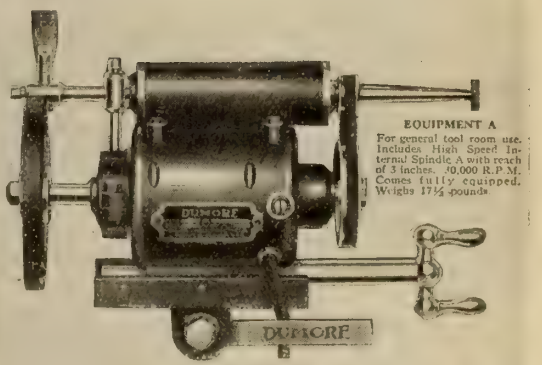
Regrinds Button-Dies in 3 Minutes

A GOOD example of one form of saving made possible through the use of the **DUMORE** grinder is found in the above illustration. Here is the attachment known as Equipment C that regrinds button-dies at the rate of twenty an hour. The special spring chuck holds an emery pencil that travels at the rate of 50,000 R. P. M. which has been found to be the correct cutting speed for work of this nature. Reclaiming these old and seemingly worthless dies, which formerly had to be discarded, means an enormous saving in the course of a few months.

The **DUMORE** grinder is portable and so constructed that the attachments are interchangeable. In other words, Equipment C may be detached and Equipments A or B put on. This gives the tool a very wide range of operation and makes it indispensable to the shop interested in securing the very best results. The **DUMORE** grinder is in perfect running balance and gives even small emery wheels the correct cutting speed. Chatter, taper or bell-mouthed grinding is thereby eliminated.

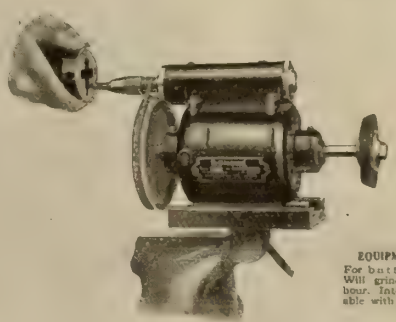
If your dealer does not carry the **DUMORE** in stock, write us for specifications and prices.

WISCONSIN ELECTRIC COMPANY
2918 16th Street — Racine, Wis.



EQUIPMENT A
For general tool room use. Includes High Speed Internal Spindle A with reach of 3 inches. 70,000 R.P.M. Comes fully equipped. Weighs 17½ pounds.

EQUIPMENT B
For deep internal work. Extension arm has 10-inch reach. 10,000 R.P.M. Arm interchangeable with internal spindle on Equipment A.



EQUIPMENT C
For button dies. Will grind 20 an hour. Interchangeable with A and B.

TRUE VALUE

IT ISN'T

WHAT YOU PAY FOR,

BUT

WHAT YOU GET

THAT COUNTS IN THE LONG RUN

THE FIRST COST OF **"MORSE" DRILLS** IS FULLY JUSTIFIED

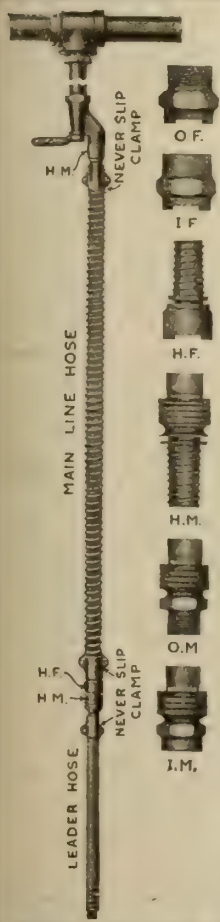
BY THE **LONG SERVICE** RENDERED

THINK IT OVER

Morse Twist Drill and Mch. Co., New Bedford, Mass., U.S.A.

A CATALOG FREE FOR THE ASKING.

CLEVELAND HOSE SPECIALTIES



Bowes Automatic Air Hose Couplings

Standard Equipment Everywhere

STYLE O.F. is an Outside Thread Female Pipe End. Made in sizes ⅜-inch to 1½-inch.
STYLE I.F. is an inside Thread Female Pipe End. Made in sizes ¼-inch to 1½-inch.
STYLE H.F. is a Female Hose End with spiral shank to insert into the hose and has groove for the Never Slip Hose Clamp. Made in sizes ¼-in. to 1½-in.
STYLE H.M. is a Male Hose End with spiral shank to insert into the hose and has groove for the Never Slip Hose Clamp. Made in sizes ¼-in. to 1½-in.
STYLE O.M. is an Inside Thread Male Pipe End Made in sizes ¼-in. to 1½-in.
STYLE I.M. is an Inside Thread Male Pipe End. Made in sizes ¾-in. to 1½-in.
The Male and Female Ends of Bowes Couplings interchange in sizes ¼-in. to ¾-in. Sizes 1-in. and 1¼-in. interchange. The 1½-in. ends interchange only with themselves.

BOWES COUPLINGS

Are instantly connected or disconnected.
They are absolutely air-tight under all pressures.
They quickly pay for themselves by stopping costly leaks.
They interchange in sizes most commonly used.
They have no loose parts to be mislaid or lost.
They are made of brass and will not rust.
The U-shaped Gasket interchanges in couplings ¼-inch to ¾-in.

The Cleco Never Slip Hose Clamp

Made in same sizes as Bowes Couplings

The adjoining cut of Cleco Never Slip Hose Clamp shows the "Flanges" which engage the groove provided in all hose ends of Bowes Couplings. The "Model Hose Line" illustrated shows correct styles of couplings and valve to use and proper way to attach the clamps.

CLECO GROOVED HOSE NIPPLE

Grooved Nipples when attached to hose with the wire clamp cannot "blow-out," as one-half of the Wire Clamp lies in Nipple Groove, and the other half on the hose, uniting nipple and hose permanently.

WIRE CLAMP TOOL

To apply Wire Clamps to Grooved Hose Nipples you need the Wire Clamp Tool illustrated, a small hand-operated tool at moderate cost which we carry in stock for immediate delivery. In Stock: Riveting and Chipping Hammers, Four-piston Air Drills, Corner Drills, Emery Grinders, Sand Rammers, Holder Ons, etc.

Use Annealed Wire No. 14

Write for Bulletin 38 illustrating Cleco Hose Fittings, Couplings, Valves, etc.

IMPORTANT:—The Small Leaks in your "AIR LINE" mean serious loss in DOLLARS. Have you any idea of the amount of "Air" wasted in small leaks at your connections? Air Leakage through 1-16 in. opening equals 5.32 cu. ft. per minute at 80 lbs. It will pay you to install Bowes Couplings and stop costly leaks.

Write for Bulletin 34A, 41 and 43.

Lenses are Easily Replaced in Stoco Safety Goggles

Celoglas Shatter-Proof Lens

Replacing a pair of lenses in Stoco Safety Goggles is only a matter of seconds. You don't even need the pliers shown in the illustration. A pencil will do—or a good stout thumb-nail. If your stock clerk is ruining his chances of salvation while he juggles a tiny screw driver and a microscopic screw, replacing pitted lenses, he'll appreciate this feature.

Price per Hundred

With extra heavy optical glass lenses	$ 90.00
With Celoglas shatter-proof lenses	115.00

Attractive discounts for quantity orders.

Lenses Only.

Per Hundred Pairs

Extra heavy optical glass lenses	$30.00
Celoglas shatter-proof lenses	55.00

A sample of the Stoco Safety Goggle will be sent without charge to interested responsible people.

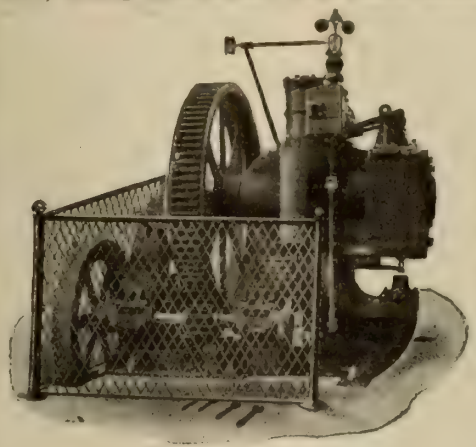
Over 36,000 Preventable Accidents

were reported in one year by the Workmen's Compensation Board. Think of the needless injury to men—the hardship to families—the huge sum for damages—represented by 36,000 **preventable** accidents. Most of these could have been avoided by the use of a few simple Dennis Wire Machinery Guards at danger points.

Put them in **NOW**—before things happen! Rough sketch of your needs, showing measurements, brings prompt estimate and folders.



WE ALSO MAKE

- Wire Signs
- Wire Baskets
- Wire Window Guards
- Wire Partitions
- Wire Doors
- Wire Racks
- Wire Screens Panels, etc.

"The Marshalltown Throatless Shears"

guarantee perfect work at less than half the ordinary expense.

Rotary, self-feeding shears designed for cutting in and out curves, straight or irregular shearing, circles, also beveling and splitting of plates. Built in various sizes having capacities from tin up to ½" thick. No limit to the size of sheet being cut. Hand, belt or motor drives. The last word in metal cutting shears. We also manufacture Rotary Bevel Shears, Splitting Shears and Plate Milling Machines.

Let us know your requirements.

Yale Brand Steel Stamps

Hand cut Steel Stamps of all kinds.

Marking Rolls and Machine Stamps.

Your Blue Prints and specifications are requested. We have a department in this line that can handle all kinds of stamp work.

HAND CUT STEEL LETTERS AND FIGURES

The very best that can be made.

They are correctly shaped and properly tempered.

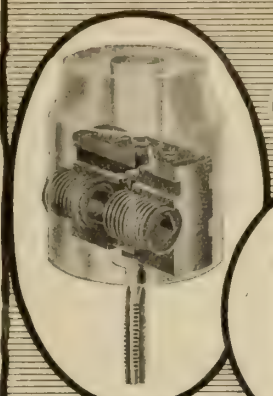
Send for catalogue.

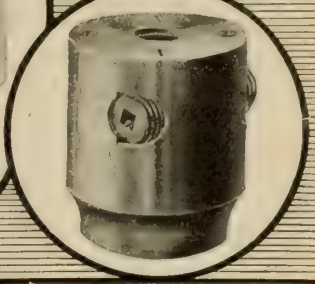
The Hoggson & Pettis Mfg. Co.

New Haven, Conn., U. S. A.

Sold by Geo. F. Foss Machinery & Supply Company, Limited, 305 St. James St., Montreal

SKINNER DRILL CHUCKS





Built For Production—Not For Price

Skinner Drill Chucks—best for accurate work. These chucks will firmly hold drills or taps accurately on centre under the most difficult and continuous operating conditions.

The Jaws are correctly adjusted, tempered, hardened and accurately ground.

THE SKINNER CHUCK COMPANY
New Britain, Conn.

New York Office 94 Reade St.
San Francisco Office Rialto Bldg.
London Office: 139 Queen Victoria St., London, E.C. 4

Buried in the Work and Broke!

Next time a tap breaks below the surface of a large casting, don't let some makeshift method of removing it injure the thread and waste half an hour of valuable production time. Instead—

Walton it Out in a Jiffy

And save the casting.

Special analysis steel fingers of the Walton Extractor drop into the flutes of the broken tap—and grip. Then a few turns of a wrench applied to the squared end of the Extractor backs out the buried tap.

Sixty-day trial offer proves the Walton Extractor pays for itself.

Write.

The Walton Co.

Hartford, Conn.

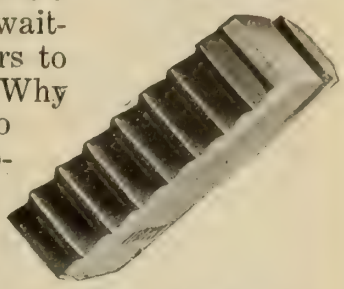
Murchey Chasers

Mean Quick Deliveries

Murchey Tools will cut your tapping and threading costs. **They will boost production 50%.** Another important feature is Murchey's **Quick Deliveries on Chasers.** This is a Murchey specialty. No waiting! We get your chasers to you when you want them. Why not use Murchey Tools to speed up your threading production?



Send for a Murchey Tap or Die on approval and give it a trial. You will then secure actual proof of its value to you.

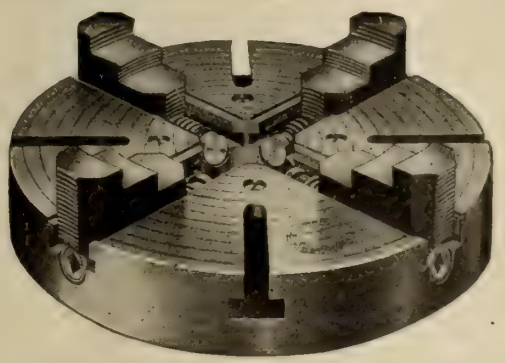
Murchey Machine & Tool Company, Detroit, Mich.

THE COATS MACHINE TOOL CO., Caxton House, Westminster, London, England, Glasgow, Newcastle-on-Tyne,
FENWICK FRERES AND CO., 15 Rue Fenelon, Paris, France

ALL STEEL

INDEPENDENT CHUCKS

are not an experiment—they have come to stay. They are a necessity with the modern machinery and high-speed steel cutting tools.



THE UNION STEEL BODY CHUCKS

are well designed and have all the elements of strength and durability for which they are designed. We make other types in steel also, including the Geared Scroll Chucks and the Geared Scroll Combination—all designed for heavy work and hard usage.

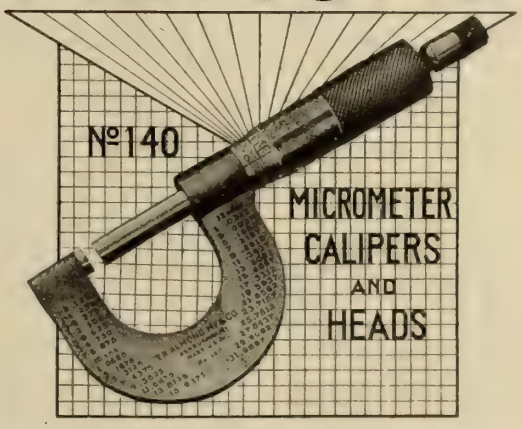
UNION MANUFACTURING COMPANY

New Britain, Conn.

New York Office: 26 Cortlandt Street

Makers of a complete line of chucks

ALMOND



All Almond Micrometers are inspected and adjusted to Johansson Gages and recognized comparison only with these gages.

Almond Service.—Should the Micrometer need readjusting at any time or defect in material or workmanship develop send to Ashburnham and readjustment or replacement will be made without expense.

OTHER **ALMOND** PRODUCTS

DRILL CHUCKS, RIGHT ANGLE TRANSMISSION LATHE CHUCKS, FLEXIBLE STEEL TUBING

T. R. Almond Mfg. Co., Ashburnham, Mass.

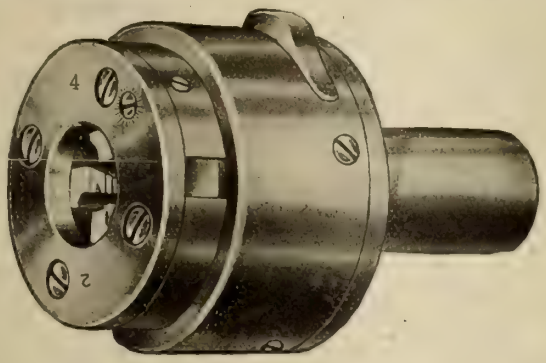
WRIGHT HOIST

HIGH SPEED HOIST

The last word in mechanical efficiency for the mills, shops, factories, warehouse, refineries, in fact all places where strength, speed and safety in hoisting is demanded.

Write for catalog giving complete specifications

WRIGHT MANUFACTURING COMPANY
Lisbon Ohio



H & G Die Heads

are of small outside diameter compared with the size of work they do.

The H. & G. illustrated is an automatic, self-opening Die Head designed especially for use on Gridley and National Acme Multiple Spindle Screw Machines and others that use the die in a revolving position. The four sizes of this Head cut up to 9/16", 1", 1¼" and 1½".

All parts are hardened and ground and interchangeable. In a word—it's an H. & G.

Eastern Machine Screw Corp.

New Haven, Conn., U.S.A.

THE BICKNELL-THOMAS TAPPING ATTACHMENT

Fits Any Make Drill

A friction mechanism inside the body of the attachment is automatically adjusted by the driving pressure, creating a very sensitive drive and eliminating the sudden strain of the reverse—responsible for many broken taps. This attachment is fitted with a plain chuck with jaws that grip both the round and square end of the tap shank.

Made to take taps from 3-32" to 1-4" in diameter.

BUTTERFIELD

Drills, Taps, Dies Reamers

and Milling Cutters

Quality in small tools means satisfaction to the skilled mechanic who uses them, his loyal co-operation to achieve the finest results.

Prolonged service under the most severe conditions have proven the quality of Butterfield Tools.

Butterfield quality is uniformly dependable

May we send you the proof — (a trial order)?

Butterfield & Co., Inc.

Rock Island, Quebec

Canadian Machinery As An Advertising Medium

By J. H. M.

THERE is a saying that no matter where we go we will meet with a doubting Thomas, and, of course, the same holds good as far as advertising is concerned.

"You've got to show me," is a favorite expression of these Missouri inhabitants, so following is proof of the most convincing character. To commence with, the writer is not connected with the advertising staff, but merely one of the editorial department. He was not in search of a glowing tale regarding the possibilities of advertising, but he was out to find how business in general was going.

The gentleman whom he interviewed was S. L. Clark, Esq., of the Perfect Machine Tool Company, Galt, Ontario.

"How's business?" was my first question, and the reply was as follows: "Splendid. We are doubling our foundry capacity and intend doubling our machine shop space directly after."

Naturally, such a reply was encouraging.

"How do you account for this rush and where is the work coming from"? was my next query.

"To your first question I would say that this is the result of producing a first-class article and advertising the same judiciously and wisely; secondly, that our orders are coming in from all over the Dominion of Canada and Great Britain," was his reply.

"Evidently you are a firm believer in advertising," I said.

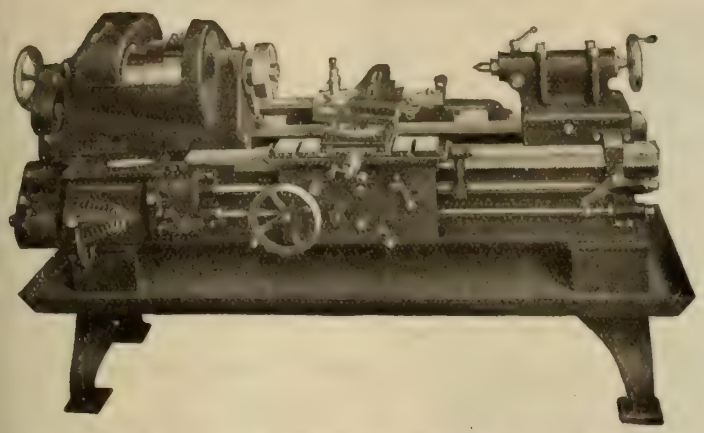
"I certainly am," was the reply. "Here are my views on the subject:

"In advertising, just the same as in anything else, good judgment must be used. You must study where to advertise, when to advertise and how to advertise. Each feature is equally important. You can spend more money foolishly through advertising than in any other way. In some cases I would not give five cents for space which they ask $10.00, $20.00 or $30.00 for, simply because I believe that no results would be obtained. In other words, I pick carefully where I advertise. I am a firm believer in the possibilities of export business and have secured inquiries from England, France, Spain and South America through judicious advertising in CANADIAN MACHINERY. We have made good connections already in England and hope soon to make connections of like nature in the other countries mentioned. The man who advertises is bound to go ahead, providing that the article he is advertising backs up every statement in his advertisement and he uses judgment in what he puts before the buying public.

"Personally, I cannot speak too strongly for the cause of advertising, and I firmly believe that CANADIAN MACHINERY, as an advertising medium, has helped us considerably in our present business expansion."

"LEHMANN LATHES"

Will Put the Same Degree of Efficiency Into *Your* Shops as They Have in Many Others



TWO SIZES—16", Swing 18¼" and 18", Swing 20¼"

Because they are constructed "right" of the best material, workmanship and design, and therefore are adaptable to all conditions, whether it be work requiring accuracy to the highest standards or for heavy duty where power, strength and rigidity are required.

Convince yourself of these facts! Let us send you complete specifications of this superior lathe and the names of some of the larger concerns who are using "LEHMANN LATHES" for better results.

We know you are interested, so don't put off writing us. Do it to-day. Now!

Hendey centering machine on centering work in plant of Can. General Electric Co. on all sorts of portions of their product.

HENDEY IMPROVED CENTERING MACHINE

Assures Perfect Results at Low Cost

The distribution of metal insures the maximum strength with the least weight of machine; in this manner we have conserved on material and hence on machine cost.

Here are a few of the **Hendey** Improved Centering Machine features:—

The head is rigidly clamped to the bed, giving permanent alignment of spindle. Spindle is large in diameter with ample bearings, having felt oilers. Front journal is made taper, after the well-known pattern of our lathe and milling machine spindles.

Jaws of vise and supporting block are made of steel, hardened and ground.

Capacity of machine is from 5-16 to 4 inches inclusive.

The Hendey Improved Centering Machine has many more points of interest. May we send you full description?

Mr. Manufacturer!

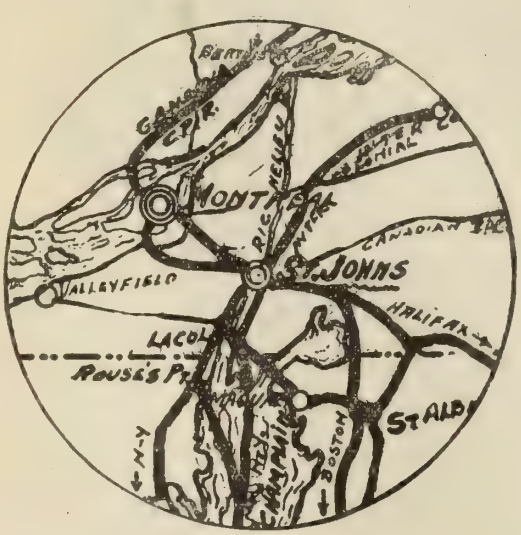
The City of

ST. JOHNS,

QUEBEC

Is an exceptionally good industrial location

Read these Facts:—



ST. JOHNS POSSESSES EXCEPTIONAL TRANSPORTATION FACILITIES from the source of raw material to the distributing centres for the finished product. On the main lines of the Grand Trunk, Canadian Pacific and Intercolonial Railways; connected with all Eastern U.S. railways; direct connection with docks at Montreal; connected by the Richelieu River with New York, the St. Lawrence River, the Great Lakes. All railways connected by a terminal switching system with very low charges. No custom delays at St. Johns.

THE CHEAPEST LABOR CENTRE IN THE COUNTRY. Skilled and semi-skilled labor, both male and female, is plentiful. Labor is unorganized and there is a remarkably low cost of living. Strikes and labor troubles unknown.

Inducements to New Industries are Unparalleled

Fifteen years' tax exemption with period subject to extension; all public improvements required, such as streets, sidewalks, waterworks, sewers. Also a bonus to you of five per cent. on your pay-roll for five years. If you desire it, the city will advance this to you to be applied to the purchase or erection of any building suitable to your purpose.

For more specific information write to

The Secretary of the City Council

St. Johns, Quebec, Canada

Our Christmas Greetings

TO OUR CUSTOMERS

THAT great army of Friends who, through their Good Will and Good Wish, have made possible the successful development of our business and,

TO OUR EMPLOYEES

OUR fellow workers whose loyalty and enthusiasm have contributed so much to our success and the development of our organization,

WE EXTEND

AT this season of joyous remembrance Our Greetings. We wish you all Good Health and Happiness, in larger measure for the year to come than any of the years that have gone.

THIS WISH

IS no different to the one we, at all times, silently entertain for you, but this being the season for expression, we proclaim to you and yours----

MAY your Christmas be a Happy One and may the New Year come to you laden with Prosperity.

ANNOUNCEMENT

THE ALGOMA STEEL CORPORATION, LIMITED, take pleasure in announcing to their customers and the Canadian trade that in accordance with the widespread desire throughout the Dominion that there should be obtained in Canada with Canadian labor, a much larger proportion of the requirements of this country in STEEL SECTIONS for STRUCTURAL PURPOSES, CAR CONSTRUCTION, SHIPBUILDERS' REQUIREMENTS, etc., they are just completing extensive alterations and additions to their rolling mills, and on or about 1ST NOVEMBER, will be ready to produce and ship American Standard Sections of BEAMS and CHANNELS up to and including 15", all standard sections of ANGLES from 6" x 6" down to 1¼" x 1¼", ZEE BARS for car builders and general purposes, small and large ROUNDS and SQUARES, and FLAT BARS up to 14" wide. The quality of the product is already well known to the trade, and is exclusively steel made by the Open Hearth process. and can be furnished in all grades from the softest rivet stock to high carbon special spring material.

MARK OF ALGOMA O.H. QUALITY

The following are the sections which will be rolled:---

ANGLES—Equal Leg—
6 x 6"—5 x 5"—4 x 4"
3½ x 3½"—3 x 3"
2½ x 2½"—2¼ x 2¼"
2 x 2"—1¾ x 1¾"
1½ x 1½"—1¼ x 1¼"

ANGLES—Unequal Leg—
6 x 4"—6 x 3½"—5 x 4"
5 x 3½"—5 x 3"—4½ x 3"
4 x 3½"—4 x 3"—3½ x 3"
3½ x 2½"—3 x 2½"—3 x 2"
2½ x 2"

BEAMS—
15", 12", 10", 8", 6", 5", 4", 3".

CHANNELS—
15", 13", 12", 10", 8", 6", 5", 4", 3".

ZEES—
3¼ x 5 x 3¼ x 5/16
3 5/16 x 5 1/16 x 3 5/16 x ⅜"
3⅜ x 5⅛ x 3⅜ x 7/16"
3 1/16 x 4 x 3 1/16 x ¼"
3⅛ x 4 1/16 x 3⅛ x 5/16"
3 3/16 x 4⅛ x 3 3/16 x ⅜"
2 11/16 x 3 x 2 11/16 x ¼"
2¾ x 3 1/16 x 2¾ x 5/16"

ROUNDS—
All sizes from ½" up to and including 4".

SQUARES—
All sizes from ½" up to and including 3".

FLATS—
All sizes from 1 x ¼" up to and including 14" wide.

MINE RAILS—
All sections from 12 lbs. up to and including 45 lbs. per yard.

PIG IRON—
Machine cast FOUNDRY MALLEABLE and BASIC.

SULPHATE OF AMMONIA.
NITRE CAKE.

For the better convenience of customers who may find it necessary to secure rush shipments of particular items, they contemplate keeping a large stock of all the various standard sections constantly on hand, and to this end extensive warehouse facilities are being prepared.
Your enquiries and business will be appreciated.

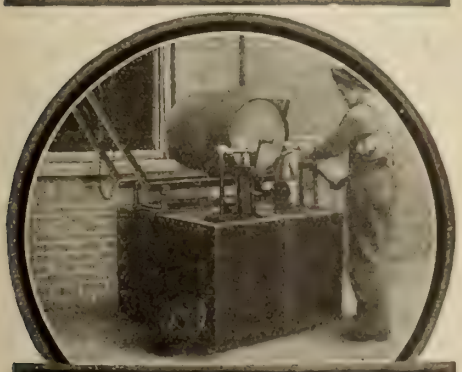
Tiresome, Expensive, Dangerous, Wasteful—but Unnecessary.



With Bowser Equipment One Man Does the Work with Less Time and Effort —and Without Loss.

STOP WASTING LABOR IN HANDLING OILS

Do away with the back-breaking, disagreeable labor in storing and handling oils.

With Bowser Storage Equipment the heavy work is done mechanically—there is no wasted energy—all oils are easily and quickly put into storage by gravity.

Save With BOWSER Systems

Distribution is done by accurate, rapid self-measuring pumps—no oils are left in shipping containers to dry up, leak and seep away—none is lost through spilling or dripping faucets. Every operation in the use of oils is done in a systematic, safe and saving manner.

Write us for literature, showing why Bowser Systems are a paying investment

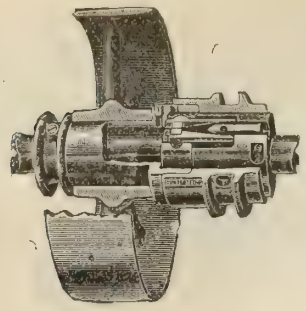
THE JOHNSON FRICTION CLUTCH



Standard Single Clutch with Pulley Mounted on Hub —Clutch Engaged.

MANUFACTURERS who are particular about keeping an established reputation equip all their machines with Johnson clutches. They recognize that superiority must be consistent in order to count. And Johnson clutches assure them of uniformly good service wherever they are installed.

Other clutches might work well in some cases—but Johnson clutches are *sure* for all purposes. We study each application on its own conditions, and build a clutch that is just right for the job.

When you are tired of experimenting, let us have a chance.

Tranco Trucks

The Universal Elevating Truck

MADE-IN-CANADA

Make a Substantial Cut in the Cost of Handling Material

When you adopt the TRANCO method you have something different from the ordinary methods of trucking. You have a simpler method—a method that is more efficient—and one that means a big cut in the cost of handling material.

With TRANCO trucks in operation you pile the material on standardized, movable platforms instead of on the floors, or fixed platforms. Then you convey the loaded platforms by means of the TRANCO truck to its destination, where they remain until the material is disposed of. Time spent in handling is thus reduced to a minimum and much expensive labor is saved. In checking up results it has been found that in many cases one man with a TRANCO truck can do the same amount of work that formerly required five men under the old system of trucking. A big factor this in view of the high cost of labor to-day.

There are three outstanding features of TRANCO Trucks—

1. **Ease of locomotion and operation, acquired by the use of Chapman Double Ball Bearings.**
2. **Operation with steering head and handle at any angle.**
3. **Safety to operator and material.**

Breakage, soilage, scratching or other injury to material is greatly reduced.

The movable platforms are compact, easily stored, and inexpensive.

In their design and construction TRANCO Trucks are all that could be desired. They are built to endure rough usage as well as steer and roll with extreme ease.

You should learn more about them. Write now for full description.

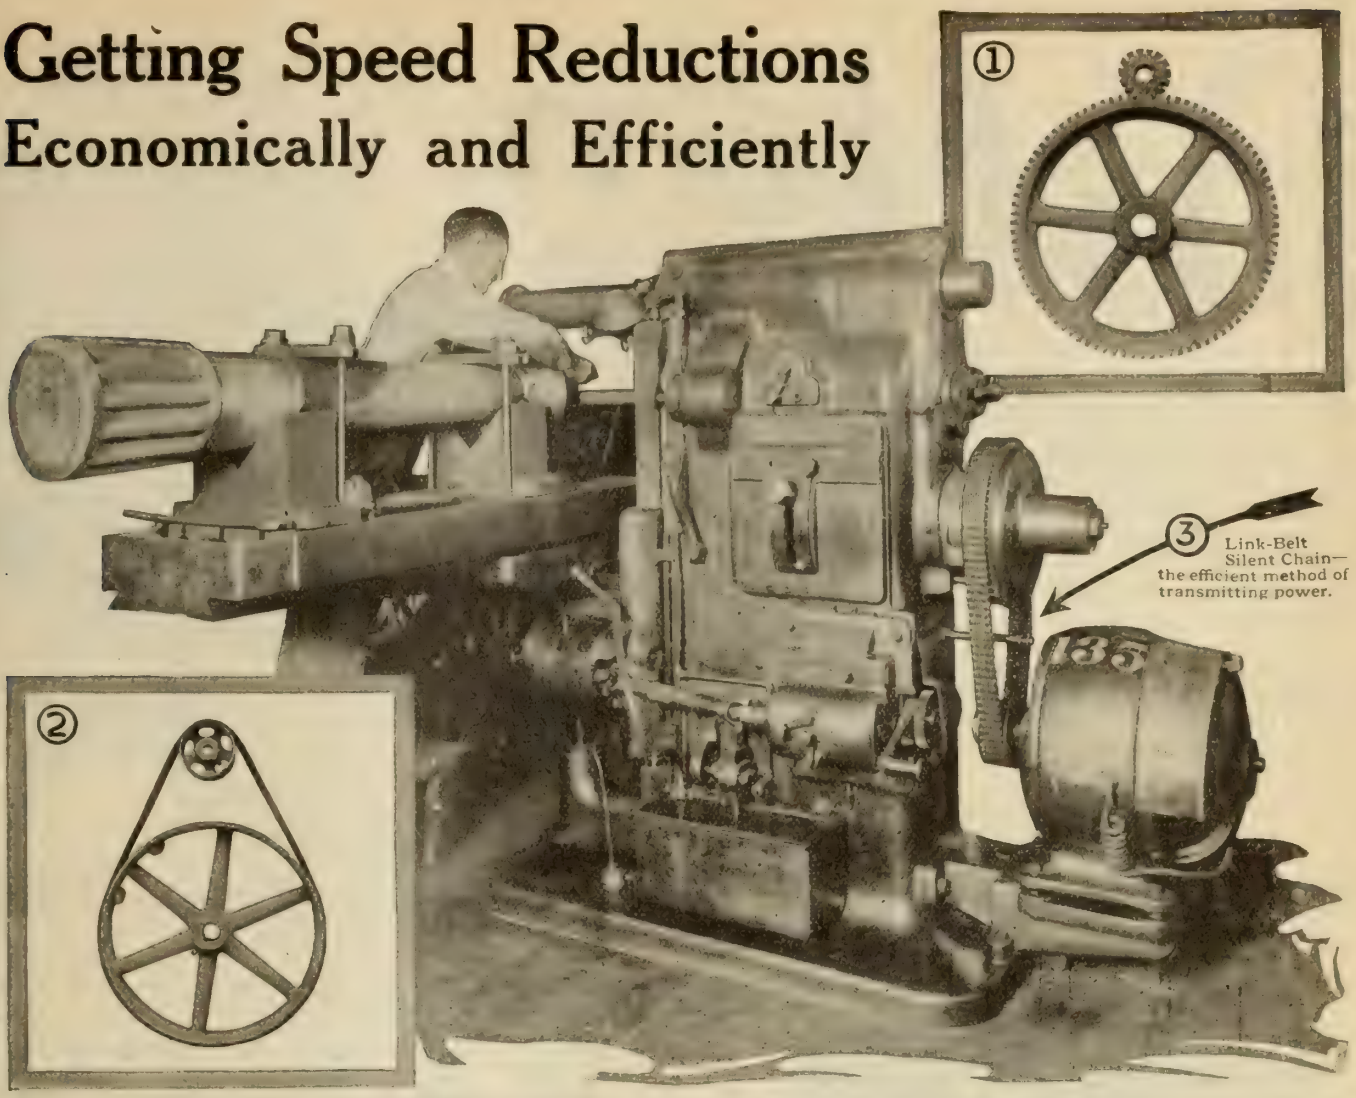
Getting Speed Reductions Economically and Efficiently



1 Shows how but one tooth carries the load, resulting in rapid wear, when securing speed reductions through gears.

2 Shows small contact secured on driven pulley when using leather belt drives. Means frequent slippage and loss of power.

3 Shows the efficient, non-slipping, long-lived Link-Belt Silent Chain Drive in securing speed reduction.

SPEED reductions are either secured by gears, belts or silent chain drives. With gear drives, there is seldom more than one-tooth in mesh and carrying the load. This results in rapid wearing of teeth, a certain amount of play between teeth, undue noise and chatter marks on finished work.

With belt drives, there is but a small portion of the surface of the small pulley in contact with the belt. This results in frequent belt-slippage, waste of power and a jerky, intermittent application of power.

With Link-Belt Silent Chain Drives, nearly two thirds of the teeth of the driven wheel and nearly half the number of teeth in the driving wheel are carrying the load at all times. There is no slippage. The motor and driven machine are both cushioned against undue shocks thus increasing their durability and a better product, better finish and greater accuracy are secured.

Our Machine Tool Book No. 312 gives full details. Send for a copy.

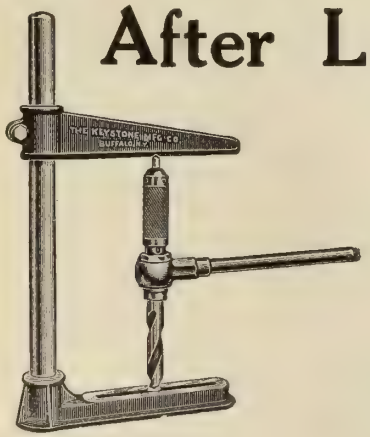
"Keystone Quality" Will Still be There After Long Use Has Worn Away The Name



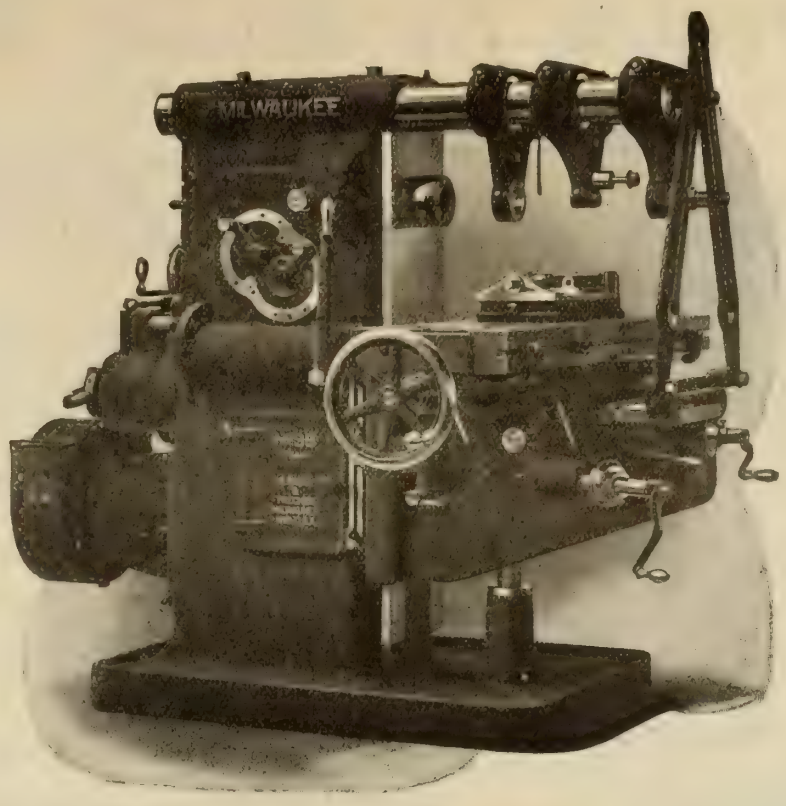
We like to think of that.

We like to think that the reputation of Keystone Tools is built upon a foundation of service with **Quality** the Keystone rather than a copyrighted name. For it is conceivable that imitators, or even the whims of courts, might rob us of our copyrighted name. But who could take "Keystone Quality" from Keystone Tools?

Write for name of nearest dealer.

The Keystone Mfg. Company

Buffalo, N.Y., U.S.A.



MILWAUKEE MILLING MACHINES

Double Overarm maintains alignment.

It is impossible for the operator to place the arbor supports on the arbor and double overarm in any other way than in line. Arbor cannot be pounded out of line when using large, coarse pitch cutters on rough, heavy work.

Other Distinctive Milwaukee Features:

Solid top knee—hardened steel gearing and shafts in the column and feed box—automatic flooded lubrication — one and one-half gallons of oil per minute pouring over all gears and bearings in the column and feed box, insuring lubrication at all times—flanged spindle with hardened steel collar for driving arbors—constant speed drive, reverse being self-contained.

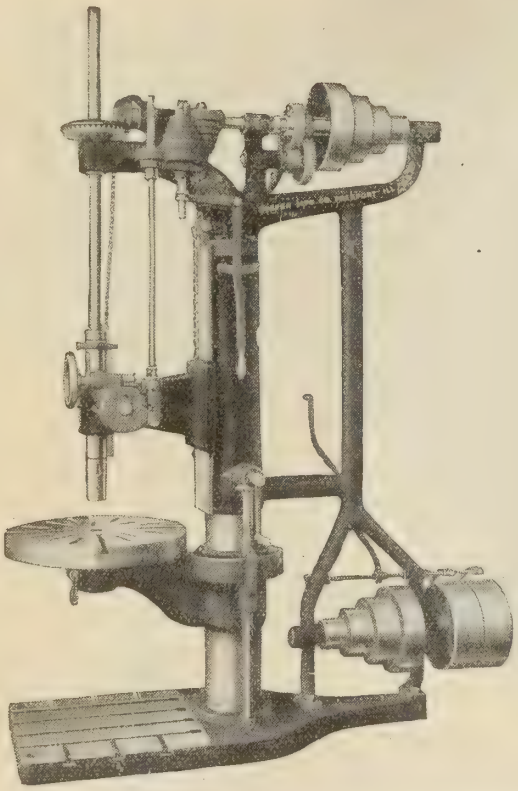
The Driller for Exact Work



HOEFER

Enable Your Workmen to Eliminate Spoilage

The Hoefer Driller is pre-eminently the one to be found in the best plants. "It's almost as good as a Hoefer," so often heard in the machine and tool trade, indicates the position held by Hoefer Drillers.

Exact drilling, to the last thousandth of an inch, pays by eliminating spoiled material. Hoefer Drillers pay for themselves and increase the workman's pride in his work.

Twenty-five Years on Market

Twenty-five years making drillers has given Hoefer the "Know-how." The Hoefer Drillers are used by many of America's leading manufacturers. Equip your factory the Hoefer way. Take any kind of a drilling problem you have to the Hoefer Manufacturing Company, and the Company's experts can tell you how it was solved by other men, some of whom you may know.

Investigate now. Write to-day for catalog. The Hoefer engineers are at your service.

BRISTOOL

Bristol 12-inch Rotary Precision Surface Grinder

Built for rapid production on grinding work.

It handles work either singly or in multiples within the capacity of the chuck and not thicker than 6-in., and grinds within quarter thousand in. of manufacturing accuracy.

And it is built to last.

It is provided with exceptionally long bearings throughout, especially in the back column. This prevents the wear, which is very slight, from affecting the accuracy of the grinder. The Back Column is made to swivel four degrees, which allows concave or convex grinding.

Bristol Rotary Surface Grinders are made in several types and sizes and are regularly equipped with 8-in., 12-in., and 16-in. magnetic chucks, either belt or motor driven and for dry or wet grinding.

Our Bulletin describes the many good points fully. Send us your name and address and we'll gladly mail you one.

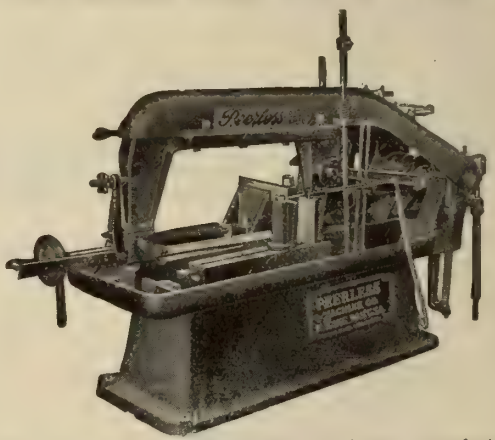
Peerless HIGH SPEED

The Standard Metal Saw of TO-DAY



While labor is demanding more and more, manufacturers are demanding machines of greater output. The "Peerless" meets that demand. It is the standard metal saw of TO-DAY.

With its rapid cut and various time-saving features, it easily increases production from 50 to 100 per cent. With its automatic feed, straight line pull, positive blade clamp and general rigidity, it gets the maximum results of which a blade is capable and reduces breakage to a minimum.

OUR SIX-SPEED GEAR BOX

(not shown in cut) further increases output and saves blades wherever soft steel or metals of varying degrees of hardness have to be cut. The "Peerless" is furnished either with or without this feature, also with or without motor.

A trial order at our risk and expense is convincing

NORTON COMPANY WORCESTER, MASS

No. 70

Truing and Dressing

Truing is always accomplished by use of a diamond; never with so-called "wheel dressers." **Dressing** is done with wheel dressers. **Truing** is not a sharpening operation, but does what its name implies. **Dressing** can never true a wheel, but it can and does break up the surface and causes it to cut more roughly and more rapidly. Only a part of its cutting points are true or perfectly concentric and not all are the same radius; therefore, the wheel is not true, although it is a fact that a wheel dresser can make a wheel approximately concentric.

One should never attempt to grind the highest grade of precision work with a wheel that is only dressed; but roughing should be done with wheels that have been dressed. This is especially true in the case of grinding from rough stock forgings like crankshafts of automobiles. In some cases, however, work is satisfactory when finished with wheels that have been dressed with a good quality of wheel dresser where, for example, a fair "commercial" finish is desired.

Use of Diamond for Truing

Accurate truing is accomplished with a diamond and this diamond should always be held in a fixed tool post—never in the hand. When the machine is equipped for wet grinding, there should always be a liberal supply of lubricant or water. Unless the flow of water on the diamond is constant, it is very bad for the diamond and also prevents the operator from securing a perfectly smooth wheel face. With the modern machines for cylindrical and surface grinding a relatively coarse wheel is used to remove the greater part of the material desired—a wheel so coarse that its grain will not allow, when cutting freely, of a finish fine enough. Therefore, after removing the bulk of the material, the face of the wheel should be trued with a diamond that does not have a very sharp point—preferably a rounded point. Then, by passing the diamond over the face of the wheel very slowly with the diamond held in a fixed tool post, a surface is produced on the wheel which is smooth and at the same time perfectly round.

This surface is a temporary one on this otherwise coarse wheel, but by careful application of the wheel to the work, so as not to disturb its surface, the desired finish is secured; in other words, the quality of the finish on the work depends upon the quality of the surface on the wheel. When a second piece is to be ground roughly, a relatively deep cut is taken by the wheel. Then this smooth surface disappears (according to the grinder he "breaks down" or "opens up" the wheel) and we have the coarse wheel in action again.

Vol. XXII. No. 26. December 25, 1919

Examples of Jig and Fixture Work

To Manufacture Any Machine, Making the Various Parts Interchangeable, Requires Certain Jigs and Fixtures. Herein Are Shown Various Types Used in Milling Machine Construction

By J. H. MOORE, Associate Editor, Canadian Machinery

THE use of jigs and fixtures with their advantages are already too well known to need any introduction. Where interchangeability is desirable jigs become an absolute necessity, for without them it is almost impossible to manufacture two pieces alike. When speaking of jigs or fixtures, it is not always necessary to picture some elaborate, complex, and expensive arrangement, for in many cases a jig can be of the simplest design yet be a most efficient aid to production.

In many cases it is not essential that a special gauge point be used, but it is essential that all pieces when drilled be alike as far as the centre to centre distance of the holes is concerned. Such a case is illustrated at Fig. 1.

At first glance this photograph is rather difficult to understand but on studying closely we note that we are looking directly down into the bottom of a milling machine base. The photograph was taken from this angle purposely, in order to illustrate both the construction of the piece, and of the jig. As can be noticed, the object is to drill seven holes, six of similar size, the remaining one slightly smaller.

To accomplish the work, no elaborate fixture was made, but simply a frame construction as illustrated, with the handle A attached to facilitate the removal of the jig. The two bolts marked B and C go through the center area of the base as shown. The jig is then pulled down into place by means of these bolts, together with clamps.

No gauge point is necessary, for the outside dimension of the framework of the jig is almost the same size as the cast depression in the machine base. The workman in this way has no trouble centering the jig close enough for his purpose. The complete arrangement cost very little, but accomplishes its purpose admirably.

Column Jig.

Another interesting jig is illustrated at Fig. 2. This represents the drilling of certain holes down the back of a miller column. Ten holes are drilled at this operation. Referring to the photograph we first call attention to the fact that the fixture is very simple in its design, being merely a flat plate as shown. Through the hole A is placed a draw bolt which pulls up a taper arbor into the spindle bore of the column. This bore is, of course, tapered to suit the spindle, and as the draw up arbor used with the jig is a duplicate of the spindle, it ensures the jig being placed absolutely central. The strap B hits up against the gear box pad, gauging in this manner from a positive point, and guaranteeing that the jig holes are not only central, but also in line with the gear box which will later be placed on this pad. At the other side of column, there is a lug going down for a distance of three or four inches. Through this lug is placed a good sized set screw, which is used to bring the strap B tightly up against the

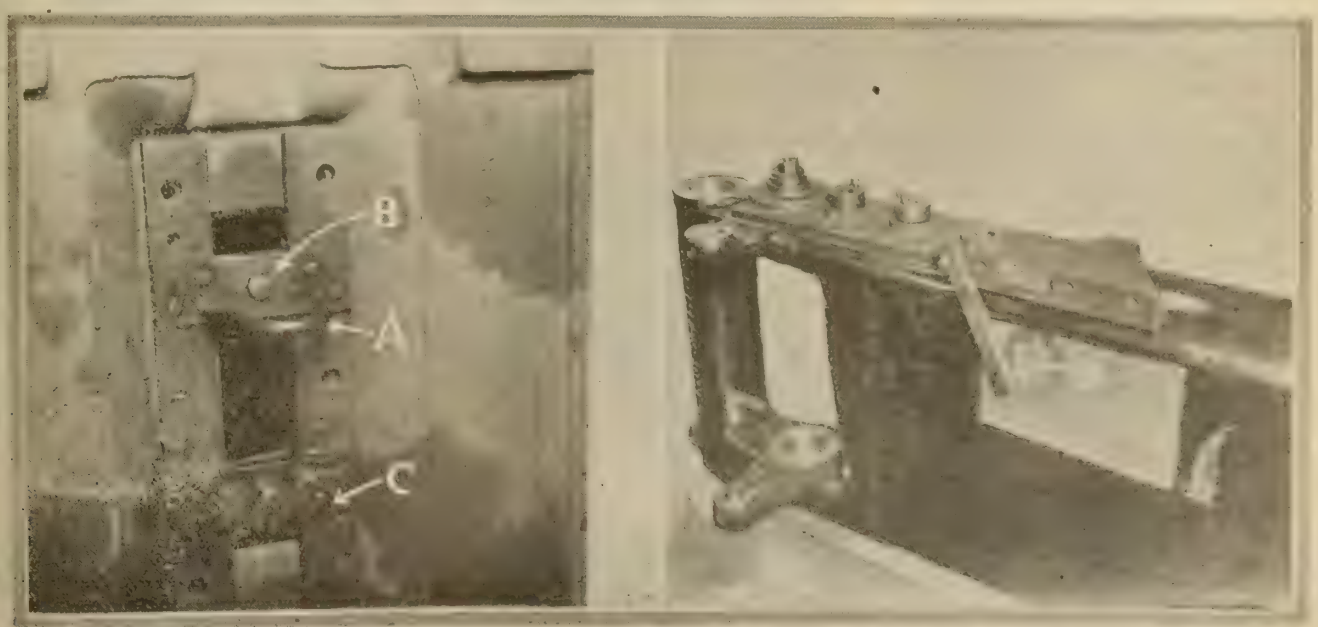

FIG. 1.—DRILLING THE BASE

FIG. 2.—DRILLING THE COLUMN

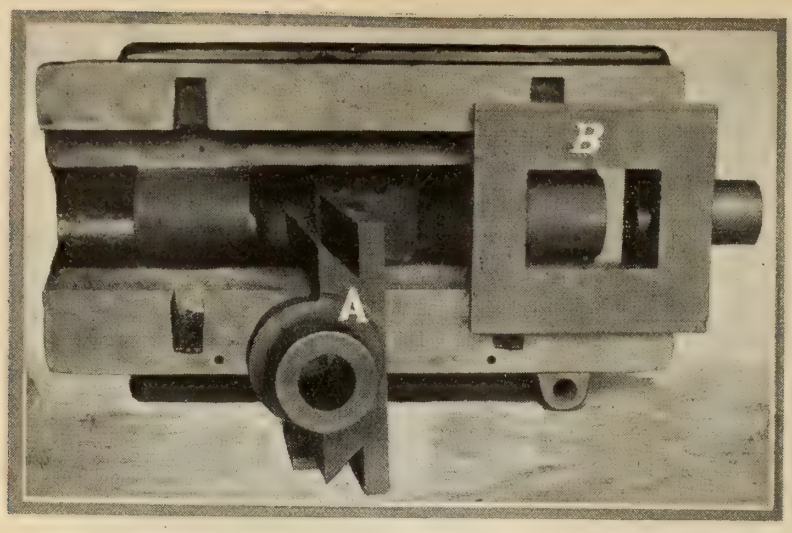

FIG. 3.—BORING THE HOLES IN THE SADDLE.

gear box pad. The jig is thus held securely while all the holes are drilled.

The third example shown at Fig. 3 represents a very simple arrangement used to drill the two main bearing holes in the saddle of a milling machine. In this case, use is made of the already finished slide for gauge purposes. The blocks A and B are castings made from the pattern of the miller slide itself. These are made in the following manner: A portion of the pattern is cast, then machined up in the regular way as if it were to be actually used on the miller. This piece is now split in two and used as shown. A section goes on the slide from each end similar to the portion B, which is shown partially in place. The regular shaped gib is used to tighten these guide blocks in place, all being held securely by means of set screws in the saddle. The bearing holes are then bored without further trouble. The bushing used is interchangeable with both holes. An arrangement, as shown, ensures absolute alignment, at very little cost for a fixture.

A jig of different style is shown at Fig. 4. This can safely be classified as a box jig, although not totally enclosed. The work to be drilled is the gear box of a miller, which is fastened in the jig in the following manner.

The gear box is placed right down to finished strips at the bottom. Gauge stops are placed on two ends as shown. There are also two adjusting screws at side of box, which brings it up to proper level. It is now finally held securely by the two set screws shown on photo, also by the clamp plates A and B which fasten over the box. These are pulled down with two bolts as illustrated. Eight holes are drilled at this one set up. Two on each side and four on top. The bushings for either side are interchangeable, while solid bushings are used for the four smaller holes on the top of the box. These holes are not visible on the photograph. The portions C and D are accurately finished parallel to the top of jig, in order to ensure that when turned over and placed on parallel blocks resting on these portions C and D, that everything will be perfectly true.

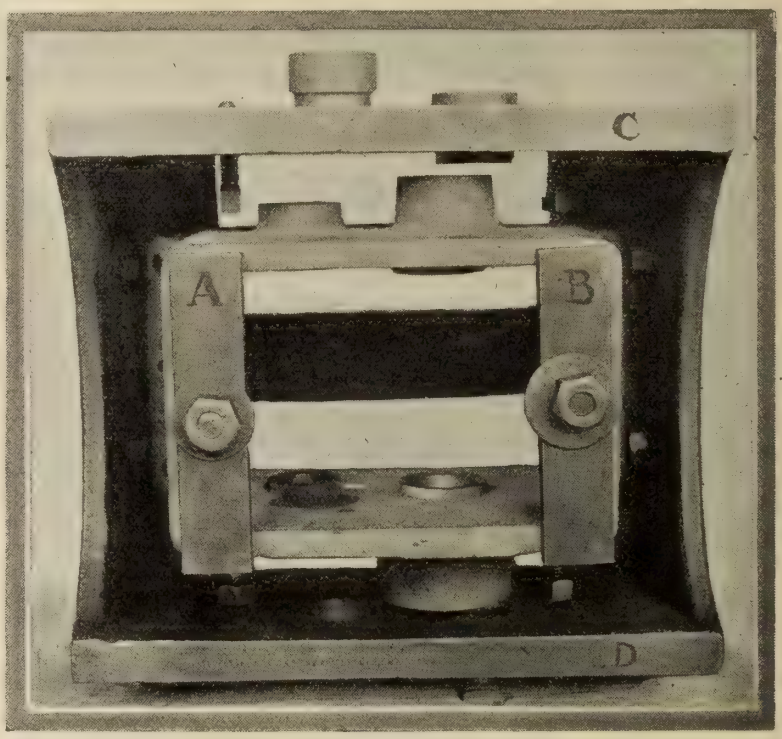

FIG. 4.—DRILLING THE GEAR BOX.

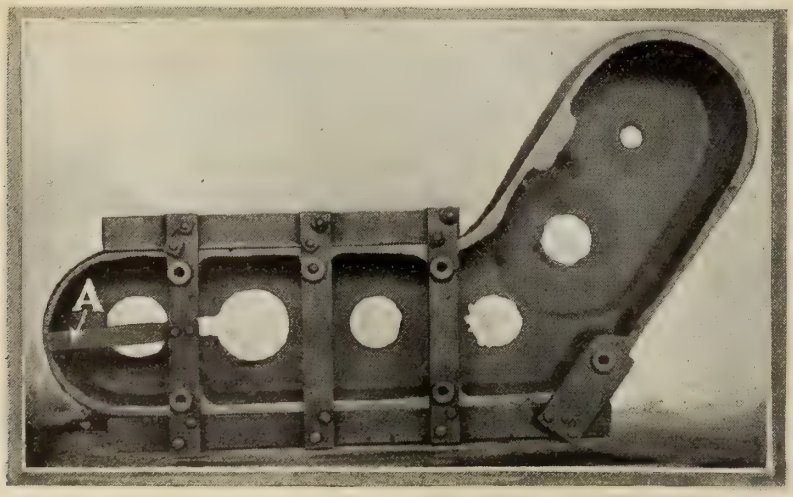

FIG. 6.—A SKELETON JIG FOR THE DRILLING OF GEAR GUARD

Gear Box Cover Jig.

The next illustration, Fig. 5, depicts a drilling jig for the gear box cover. This takes care of the top hole A and the two side holes B and C. The work is slid into the finished slide D until the end of the cover hits the adjustable stop E. It is also adjusted if necessary from the side by similar adjusting screws, which can be clearly seen on the photograph.

The work is held securely by means of the top binding screws F and G. One bushing accommodates the three holes, as it is interchangeable with all three, each hole being the same size.

The next and last jig described in this portion of article is used to drill the six holes at back of gear guard shown. Positive stops are used at one side of guard, while adjustable screws are used to tighten up the jig to the guard at the other side. The jig is gauged lengthwise by means of the strap A. The por-

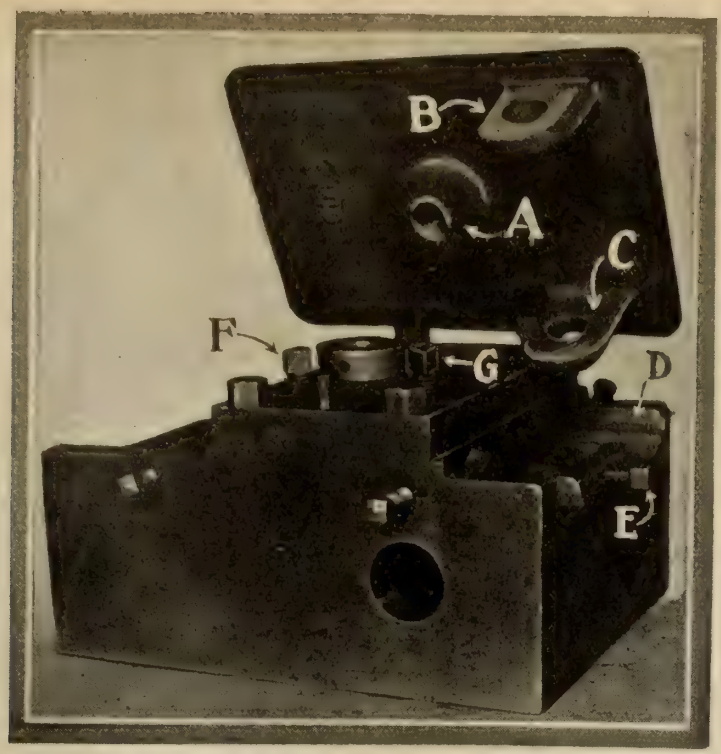

FIG. 5.—DRILLING JIG FOR GEAR BOX COVER.

tion of guard gauged from is easily seen on the photograph. Readers will note that this jig is merely made of flat steel, yet this frame work accomplishes its purpose equally as well as any other more elaborate arrangement proving that it is not always the expense of a fixture that gauges its field of usefulness.

In our next portion we will illustrate further types of jigs used in the producing of these milling machines.

WATER POWERS OF CANADA

At the regular meeting of the Toronto section of the American Institute of Electrical Engineers, held in the Engineers' Club on Friday, December 19th, a very interesting paper on the "Water Powers of Canada" was read by Mr. H. Harvey, of the Hydraulic Department, Hydro-Electric Power Commission of Ontario. The paper, which was illustrated by lantern slides, presented a summary of the extent of one of the great assets of the Dominion, and outlined some of the extensive developments under way or in contemplation at the present time.

The Maritime Provinces are not so abundantly blessed with water powers as is the remainder of Canada, but while large developments are not possible, there are many smaller powers available for use in the pulp and paper industry and for use in the exploitation of mineral resources. Quebec is very fortunately situated as regards potential water powers, and while large developments have already taken place, the greater portion of the water powers of the province still remain unutilized. There is, at least, 240,000 horse power still available and capable of easy development near Montreal, while the Saguenay River system and Lake St. John are capable of furnishing over 1,000,000 horse power. This, together with other potential water powers near Quebec City, will undoubtedly benefit industry in this vicinity. The water powers of Quebec will be of immense value in the exploitation of the mineral wealth of the province, and particularly so in electro-chemical and metallurgical industries.

The same applies to the water powers of Manitoba and within a radius of 100 miles of Winnipeg; it is altogether probable that large communities, dependent upon electro-chemical and metallurgical industries, will spring up. The fixation of atmospheric nitrogen for the making of fertilizer will undoubtedly be one of the most promising fields for manufacture, since Manitoba is so conveniently situated, as regards the grain-growing section of the country.

The Prairie Provinces have available considerable water power, the Bow River and the Saskatchewan being capable of considerable development, while the farther-north, the Churchill River emptying into Hudson Bay, has over 1,000 feet head throughout its course.

The Athabasca and Peace Rivers, too, are capable of development, but their location in the north country, emptying as they do into the Mackenzie River, which flows into the Arctic Ocean, renders them of value for the future only.

Little need be said of the value and extent of the water powers of British Columbia, since it is widely known that this province, owing to its topography, is particularly fortunate in this respect. The mountainous nature of the country, together with its many glacier-fed streams, renders high head water powers of fairly constant flow available. The pulp and paper industry of Canada, in 1918, represented a turnover of 110 to 115 millions, and of this amount British Columbia furnished only eight per cent. If this industry alone were developed in this province to its full extent, a marked increase in the amount of power used would occur. Vancouver Island is possessed of many large water powers, a total of 500,000 horse power being available.

The Yukon and Klondyke regions have many water powers, and some of these are developed at the present time, the power generated being used in the operation of gold dredges.

The Province of Ontario is the largest industrial centre of the Dominion and at the same time is possessed of the greatest natural wealth in water powers. This is particularly fortunate, in that her coal resources are non-existent. The water powers of the province are divisible into four main divisions, the Ottawa River basin, the Great Lakes, the James Bay basin, and the basin tributary to the Winnipeg River area. The characteristics of these four basins vary greatly, and in some of them the results of deforestation, etc., are noticeable. This is particularly true of such rivers as the Grand and Thames, where the character of the river has been changed from one of comparatively uniform flow to one of excessive run-off, of little use for power or navigation. In all, Ontario possesses 5,000,000 horse power capable of development. This figure includes international boundary waters up to the treaty limit only.

In the paper, and in the discussion which followed, the importance of water power development was emphasized, and the necessity of eliminating the importation of the 25,000,000 tons of coal now brought into the country was brought out.

P. W. Ellis, chairman of the Niagara Falls Park Commission, took part in the discussion, and gave some interesting facts relative to the developments in the Niagara district. He also mentioned the extensive plans of the Commission for the making of this district into a national playground. The necessity for the fullest development of the Falls was also emphasized, and in the further discussion which followed that of Mr. Ellis, it was brought out that the probable limitation of the developments at the Falls would not be affected so much by the necessity for the preservation of scenic beauty as by ice removal. A sufficient amount of water during the winter months must flow over the crest to remove this source of trouble.

The Niagara River may be said to be 39,000 years old. In the earlier stages of its career, it drained Lake Erie only, and took 32,000 years to cut back to the present whirlpool. At this time, an upheaval took place, which diverted the waters of the upper lakes into this channel and lowered the level of the old Lake Iroquois, now Lake Ontario, to its present limits.

The Internal Grinder on Locomotive Parts*

Grinding Machines Are Now Being Used to Good Advantage on Various Operations on Locomotive Work. Accurate Results Are Naturally Obtainable by Such a Process

IN comparison with the ordinary run of machines, the work done on a locomotive's mechanical makeup is crude.

Recent propaganda, however, regarding conservation of energy, saving of fuel, and lost motion, has been reflected in the more up-to-date locomotive shops by the installation of grinding machines. These machines have been installed to produce a superior finish on various surfaces which heretofore have been turned, reamed, or lapped.

Internal grinding machines have come into the shops to stay, more particularly

FIG. 1

the heavy type of machine, the universal or tool-room grinding machine lacking the rigidity necessary for locomotive work where speed is necessary.

To heavy types of machines that are proving their worth are the internal chucking grinding machine on which the work is revolved, similar to the method followed on the tool-room grinder, and the type with the eccentric spindle on which work is placed in a fixture. On account of the large size and irregular shape of many locomotive parts, they cannot be readily revolved, and hence the eccentric spindle or cylinder grinder is usually best adapted to railroad shop work.

A machine of this type may be seen in action in Fig. 1, finishing a bearing in a valve motion link. It may be noted that the grinding wheel bears against the right side of the hole. As the cylinder B revolves one-half turn, the wheel will bear against the left side, thus making a circle, touching all points of the circumference of the bushing to be ground. In practice, adjustments are made to the table so that the grinding wheel will just touch the inner surface to be ground at all points. As the hole is gradually ground, the amount of eccentricity of the spindle is increased by turning the nut D. With this form of machine, holes from 1½ in. to 12 in. diameter may be finished. The table for holding the work has a longitudinal motion, controlled by the customary form of tripping dogs, which cause the table to travel back and forth in a manner similar to that used in the general run of grinding machines.

*From "Machine Tool Review."

Holes in Valve Motion Levers and Bushings

There are many parts of a locomotive where it is possible to make use of the internal grinding machine, either in the original makeup of the machine or in doing repair work. Particularly in repair work is the machine of great use, as there is no question that there is a great saving of time and money, to say nothing of the fact that a better job may be performed which necessarily means fewer renewals.

Take for example valve motion levers, parallel rods, and various other similar parts. The holes in the rods or in the bushings or bearings applied to them, are often found worn oblong or rough, or the holes in the levers are distorted as a result of the bushing becoming loose in the levers. In many cases the holes may be trued and thus avoid renewing the bushings or reaming the lever. Reaming would, in some cases, be the quicker operation, but it would not produce as true a hole and would result in enlarging the hole more than by grinding, thus shortening the useful life of the levers or rods.

In addition to valve motion levers, the holes in side rods, knuckle pins, bushings and a number of larger holes may be ground. Another use for this machine is that of grinding the round holes in links into which the pins fit and also the holes in the link blocks. These are often case-hardened, and when they become worn in service, or when they have been warped in case-hardening, it is much easier to true the holes by grinding than by any other method.

In Fig. 2 may be seen the internal grinding machine at work grinding holes in side rods which will be made perfectly round and true before pressing in new bushings.

Airbrake Parts

In addition to the internal grinding mentioned above, this form of machine may be profitably employed on various airbrake parts, among which, for example, are triple valves. The inner surface of the cylinders where the piston travels should be re-finished accurately and smooth. This desired surface can be obtained very quickly on the internal grinding machine, and the work will be much superior to boring or reaming. Fig. 3 shows an internal grinding machine finishing the hole in a bronze bushing that has been forced into place within the equalizing cylinder used in connection with the airbrake. This has been also used by the Pennsylvania Railroad, New York Central, and others for re-grinding worn bushings of triple valves used in connection with airbrakes.

To refinish a very badly worn cylinder it may require more time than on a boring machine on account of the large amount of metal to be removed in order to true up the entire surface. Even so, the grinding would generally be more economical when considering the life of the cylinder. When boring there is always the possibility of the workman setting the boring tool to a larger diameter than is necessary to true the cylinder in order to get below the hard surface. With grinding this danger does not exist, for the hard surface does not affect the grinding and the workman will naturally not do any more work than is necessary.

Some of the other uses to which the internal grinding machine can be put in locomotive shops are: (1) getting a true round hole in the hard bushing; (2) in the side rods where the bushing bore has become slightly elongated near the surface the hole can be made perfectly round and true before pressing in a new bushing; (3) grinding small holes by making use of an extensive arm or quill, which goes with the equipment of this machine and enables the grinding of holes smaller than the standard arm will take.

The Maintenance of Bridges and Buildings

Illustrating How Compressed Air Can Be Used to Advantage in Speeding Up Such Work. Some Hints Are Also Given as to the Equipment Necessary

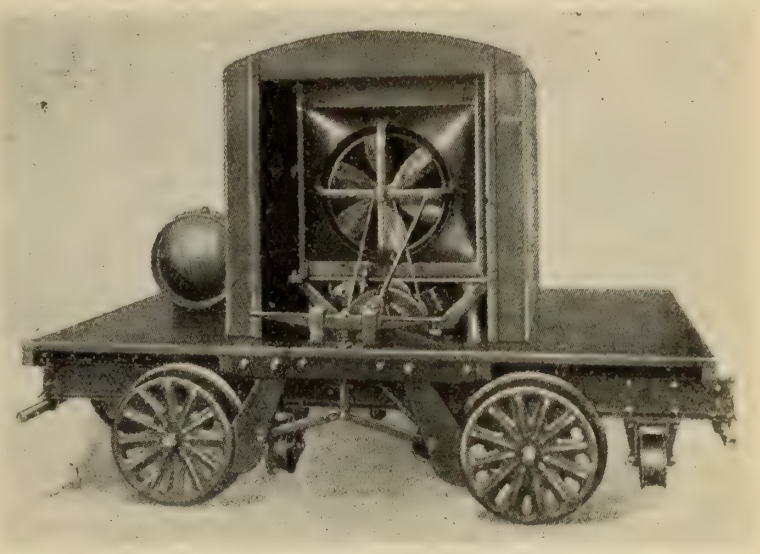
By F. A. McLEAN

ALMOST from the inception of the application of compressed air as a means of power transmission, the railroads have been among the largest users of air-operated appliances of various kinds, in locomotive and car shops, signal systems, etc. This is perhaps not at all strange when one stops to consider what an important part the air brake has played in the development and operation of modern high speed railroad equipment.

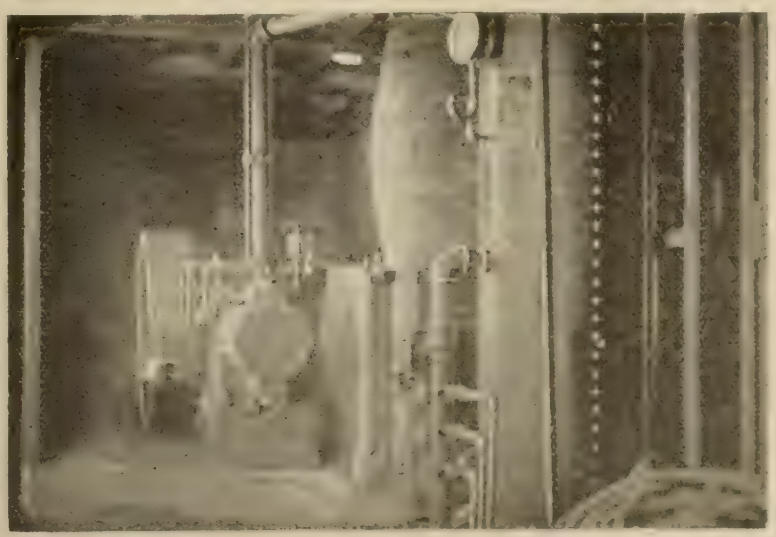
About five years ago the pneumatic tie-tamper was introduced, and although it met with considerable opposition, it has been adopted as standard equipment by practically all of the largest steam roads in the United States, as well as on many city and interurban electric lines. In Canada it has made somewhat slower progress, due perhaps to the fact that cheap labor was more readily obtainable than in the United States, and to the natural reluctance of many men to use anything with which they are not familiar, or which they think is still in an experimental stage. A few of these machines are at present in use on large Canadian steam and electric roads, and in view of the report of the Committee on Labor-Saving Devices, presented at the thirty-sixth annual Convention of the Roadmasters and Maintenance of Way Association of America, at Chicago, Ill., September 17-19, 1918, that in their opinion no tool in recent years furnished to the track forces had made its appearance at a more opportune time, or filled in a greater void than the air-operated tie-tamper, it seems entirely reasonable to expect that within a few years, as the maintenance of way officials become better acquainted with their merits, these tools will be as extensively used on the steam and electric lines of this country as they are in the States.

Labor is generally conceded to be the largest single item entering into maintenance of way and structure expense, sometimes being as much as, or more than all other items combined, averaging from 50 to 55% of the total, and the saving in this respect which the use of pneumatic tie-tamping outfits has made possible in the operations of laying new track, replacing old track, or re-surfacing track which is already in existence, has caused some of the more progressive bridge and building masters to devise means by which compressed air could be applied to their particular branch of railway maintenance and construction work.

A number of roads have fitted up old box cars as portable compressed air power plants of sufficient size to operate a number of tie-tampers, or other air tools, by the installation of steam, gasoline, or electric-driven, straight line compressors with water tanks and air receivers of the proper capacity. An outfit of this kind is easily rigged up and is very useful, but has one or two drawbacks which limit its field to some extent, in that it cannot be readily moved from one section to another without the use of a locomotive, and due to its weight and bulk, it can not be removed from the rails, and is thus only available for use where traffic is light or where a convenient siding is at hand.. Mounting the compressor on an automobile chassis or horse-drawn vehicle gives a little more lee-way in this respect in the case of electric roads, but is not of much use on steam roads, as the road bed is seldom wide enough to allow the use of a vehicle of this type, and roads or highways are often some distance away from the railroad tracks.

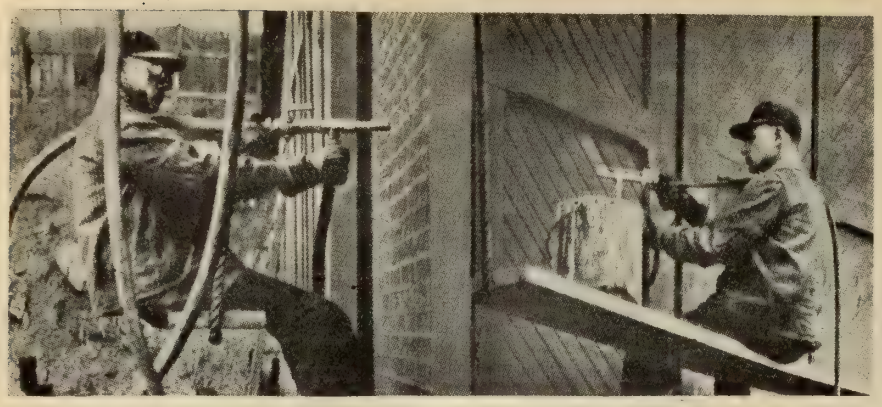


SELF PROPELLED GASOLINE DRIVEN COMPRESSOR CAR.



AN OLD BOX CAR CONVERTED INTO A PORTABLE COMPRESSED AIR POWER PLANT.

A type of outfit which overcomes these disadvantages and provides a simple, compact and self-contained outfit, which will enable bridge and building departments to make use of compresed air to the widest extent, is now being built by the Ingersoll-Rand Company, under the trade name of the Imperial Bridge Repair Outfit. The power plant or heart of this outfit consists of a direct-connected gasoline or electric-driven compressor, of sufficient size to supply four air lines, mounted on a machined subbase, which is attached to a heavily constructed vehicle of the push car type.



CLEANING A BRICK WALL WITH A SAND BLAST. PAINTING ROUNDHOUSE DOORS WITH COMPRESSED AIR.

identical in construction with those supplied with "Imperial" pneumatic tie-tamping equipment.

For the use of steam roads, or electric roads which prefer a self-propelled outfit, an engine of the two-cycle type, fitted with an automatic governor that controls the speed by acting on a throttle which forms an integral part of the carburettor, is provided. An automatic pressure operated unloading device placed between the discharge line and the air receiver, keeps the pressure in the latter within the desired limits. The engine-driven car is self-propelled by means of a sprocket and chain which can be thrown thrown in or out of gear by a clutch connection with the main shaft. The car has sufficient power to haul twelve men, in addition to the tools and accessories supplied with the outfit, at a speed of 12 to 15 miles per hour, and will readily climb a 4 per cent. grade when fully loaded. The brakes are operated by the foot and have a holding power considerably in excess of what would be required under ordinary conditions, so as to provide an ample factor of safety should the engineer suddenly stop while the car was climbing a grade.

The motor-driven outfits are provided with a drawbar socket for coupling to a street car or electric locomotive, and both outfits are equipped with cross trucks or wheels for quickly removing the car to and from the track. A removable sheet housing protects the working parts from the elements when it is necessary to leave the car out of doors for any length of time, and may be locked to prevent tampering if desired.

Each car is ordinarily fitted up with a pneumatic drill with sufficient power to ream and tap up to one inch or drive a 1¼ in. twist drill, a riveting hammer or gun with ¾ in. and 1 in. rivet sets, a set clip and a rivet buster chisel, also unique sand blast and paint spray nozzles. The drill is useful for drilling and reaming holes in structural members of bridges and buildings, boring holes in ties, running down screw spikes and lag screws, tightening bolts, drilling and reaming holes in rails for bonding and joining, while the hammer is applied to such jobs as driving or "busting" rivets, and chipping metal in steel culvert, bridge, cattle guard, or tank work, and for barking ties, etc.

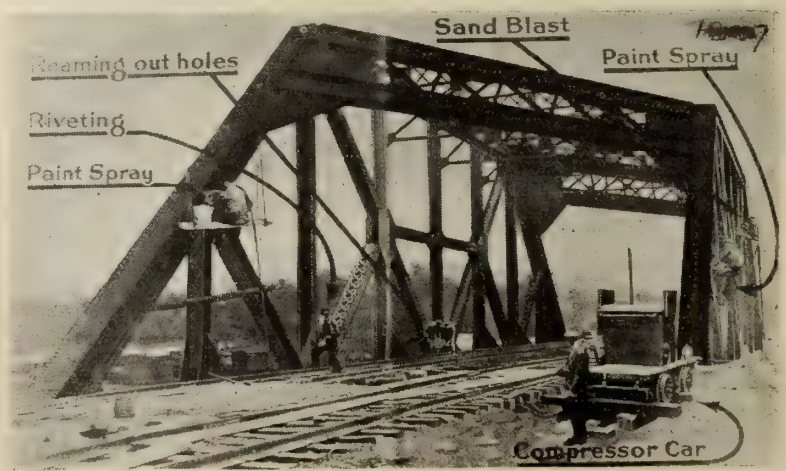
Although the application of pneumatic drills and hammers to bridge and building repair work is by no means new, the use of the sand blast and paint spray for this work is, however, a decided innovation on many roads. The advantages accruing from the use of these devices are readily apparent. With the sand blast it is possible to clean off rust and scale more quickly and thoroughly than would be possible by any other method. This is especially true in the case of sharp corners, pockets, lattice work, etc., the cleaning of which, by hand, is a very tedious and costly job. The sand blast is of a very simple type, does not require tanks or special equipment, is easily operated, and has been found economical in the use of sand, which may be of any variety so long as it does not contain gravel or pebbles. Wherever it is possible to do so, it is a good plan to arrange a piece of tarpaulin in such a way as to catch the sand, which may then be used over again several times. The sand may be taken from a pit, a pail, or even a loose pile as may be most convenient in each case. The weight of the attachment is about eight pounds, and it is adapted to a wide range of work on stone, concrete, or steel.

The paint-spraying device, which weighs approximately two pounds, applies a solid uniform coating of paint, whitewash, creosote, or any other liquid of as great a thickness as may be desired, in one operation, thus doing away with the necessity of applying three or four coats by hand, resulting in a saving of about 90 per cent. in time. The density of the spray is subject to accurate control, the nozzle being adjustable for a light or heavy coat with various grades of paint, which can be drawn from any type of container, the most common way being to take it from a can placed on the scaifold near the painter. With the paint spray there is no need to stir the paint, as the action of the air keeps it thoroughly mixed, assuring a coating of uniform quality at all times and being applied under pressure, it is forced into cracks, corners, etc., which could not be reached with a brush.

Through the use of these appliances five or six men can efficiently perform all of the odd jobs incident to the maintenance and repair of bridges and buildings in a minimum of time, and, in addition, the compressor car provides a convenient source of power for use in tamping ballast, adzing ties, breaking out frozen coal, or tearing up concrete or asphalt pavement with pneumatic tampers, grinding rails for bonding or switch points, cutting off timbers with a pneumatic saw, running pneumatic rammers for ramming concrete, or ramming earth around culverts, retaining walls, pipes, etc., or for operating concrete mixers, hoists, pumps, jacks, etc.

As examples of the time saving which can be effected by the use of equipment of this kind, the N.Y., N.H. & H.R.R., operating four pneumatic drills with a special clamping and feeding attachment, by one of these cars, drills 9-32 in. holes in 100-pound rail at the rate of 70 holes per minute, not counting the delays due to traffic and moving of the drills, each of which are operated and shifted by one man. On the C.M. & St. Paul R.R., 1,000 ⅞ in. holes are drilled in the web of 85-pound rails per day, all delays due to traffic and moving included, by four men operating two close-corner drills, fitted with special clamping and feeding arrangements.

These outfits weigh approximately 3,300 pounds, and in removing them from the track each side of the car is raised two or three inches in turn, allowing temporary rails formed of 2 x 4 in.



A PNEUMATIC BRIDGE REPAIR OUTFIT IN ACTION.

scantlings to be placed under the cross trucks or derailing wheels at each end of the car. These small wheels have double flanges and have their tread about two inches higher than that of the main wheels. Four men can lift the car with ease upon these simple cross rails and roll it on to a stand formed by driving short posts into the ground and cutting them off at the desired level, or on to a crib prepared by laying ties on the ground or shoulder of the roadbed at the point where it is desired to move the car from the track. The actual time required for four men to remove or replace the car on the track, once the stand or crib is built, is about forty-five seconds.

Through the use of self-propelled, air-operated, bridge repair equipment, it is possible to greatly reduce the size of the repair gangs required, which is an important factor when the scarcity and high cost of labor, and often the low efficiency of that which is obtainable, is taken into consideration. Reducing the size of the gangs, avoids the tying up of locomotives and cars for work train service, and the men are often carried to their work, the job finished, and the men back again before the materials for performing the work by hand could be loaded on cars, switched into a way freight or work train, and transported to their destination ready for use. One of the large Eastern roads among the first to adopt equipment of this type found that through its use they could reduce their labor turnover to a large extent, as the strain on the men was considerably less than when hand-operated equipment was used exclusively, and the fact that the outfits were self-propelling made it possible for the men to live at some distance from their work in order to take advantage of lower living expense and still be on hand ready to start work at seven o'clock in the morning, the company building a section house convenient to the men's homes, where they assembled a few minutes before seven each morning, started the car, and arrived at the scene of their labors in a few minutes, and were back again in good time at night.

WELDING BURNED IRON DURING THE WAR

Many welders will refuse to attempt to weld burned iron, especially grate bars, and while a true weld is hardly possible, yet, by using muriatic acid as a flux, an adhesion can be made that will last until the damaged part can be replaced. In fact it will last almost as long as if it were really welded, unless it is struck a hard blow.

Among the users for acetylene during the great war, perhaps there was no application more simple and effective than acetylene in the form of portable lights, or flarelights, as they are often called.

The uses to which these lights were put were almost to numerous to mention. The following, however, are some of the most important ones:

Commencing with the rush of work of preparing for mobilizing the American army, the building of the cantonments was rushed, the bases equipped, materials moved, roads constructed, training and drilling done, under the white and widely diffused rays of portable acetylene lights giving from ten to fifteen thousand candle power.

In speeding shipbuilding these acetylene lights played their indispensable part from the laying of the keel until the superstructure was finished.

From the time of launching, acetylene lights were used in equipping and loading ships for their hazardous voyages. These lights were also fitted to the decks of many of the merchant vessels, which time after time braved the skulking submarine, to be in readiness in case the vessel was torpedoed and the electric lights put out of commission. Acetylene was found to be the one dependable light which would aid until the last moment the doomed vessel remained afloat. Indeed, after the vessel was sunk—buoyant, self-lighting and inextinguishable—acetylene lights still served in the work of rescue, and then portable acetylene lights were used by the salvage crews of the navy.

As fast as our ships reached the shores of our Allies, thousands of lights were used for unloading munitions, equipment, stores and men.

As the stream of men and war materials of our army moved forward toward the front, portable acetylene lights were constantly employed. They were used for the laying of railroads, building of stations, for the moving of freight, for the construction of bases, for the erection of bridges, for the building of emplacements for guns, and for the vast variety of work incident to the movement and maintenance of a great army in its titanic struggle for the freedom of the world against the tyranny and despotism of an implacable military power.

Acetylene lights were also used for guarding the alien enemy internment camps at night in this country, and in preventing the escape of enemy prisoners abroad.

The success and safety of so much of the machinery of war depended upon the operation of the portable acetylene lights. A number of them giving an aggregate of 50,000 candlepower were used for the starting and landing of aeroplanes and dirigibles at night. These acetylene lights flooded their light on large areas near the aerodromes to permit the safe return of the swift pilots of the night in their journeys from the enemy's zone.

Portable acetylene lights with constant delivery pressure were used by the photographic section of the aviation corps for the development of photos taken of the enemy lines.

Acetylene was employed in its subtlest and most scientific form to produce sensitive films on which needles recorded the direction and intensity of the enemy's artillery fire, aiding largely in the discovery and discomfiture of the enemy, or in frustrating his plans.

Acetylene portable lights played their unfailing part in the rescue of the wounded. Nurses, members of the Red Cross and Medical Corps, used hand acetylene lights with shutters, which enabled them to instantly throw the rays on and off the wounded upon the battlefield, or sufficiently long for treatment. After they were rescued, acetylene furnished the light in field hospitals for surgical operations, for the heating of water, and cooking of food for the sick and wounded. — "Acetylene Journal," Chicago.

The Use of the Pyrometer in Steel Industry*

An Interesting Paper Discussing the Progress Made in the Accurate Measurement and Control of High Temperatures in the Heat Treatment of Steel of All Kinds

By R. P. BROWN

IF anyone stops to consider the remarkable progress which has been made in the accurate measurement and control of high temperatures in the heat treatment of steel, one realizes that this progress has been phenomenal during the past ten years. This progress has been largely due, first to improvements in temperature measuring instruments, and secondly to the education of the user in the proper use and care of pyrometers.

It is safe to say that greater progress has been made during the past ten years in the use of pyrometers than was made in the two hundred preceding years during which pyrometers were known and used to some small extent. This progress has been largely due to the constant efforts of pyrometer manufacturers to develop and improve their instruments.

It is also true that in the last ten years an unusual amount of interest has been exhibited by the men who must use pyrometers, in becoming fully acquainted with the construction of the various types of pyrometers which are available and the proper installation of the instruments in order that they will give the best results and the proper method of using and checking the instruments.

Numerous papers and books have been written on this subject, and one has only to call on any steel plant to-day and interview the metallurgist or the practical hardener, to realize how much more these men know of pyrometers than the man of ten years ago. One rarely calls at a plant where heat treatment of steel is carried on where the man who is charged with this work is not well acquainted with the use of pyrometers and the proper equipment to use for his requirements.

Ten years ago it was a question solely of endeavoring to convince the prospective pyrometer user that he should use a pyrometer. He had never used one before and it was a difficult matter to convince him that the instrument was necessary. To-day it is a question of convincing the same man that a certain type of pyrometer is properly designed to best meet his requirements, that it will give maximum life under his conditions, and that the pyrometer installation will require a minimum amount of attention. He does not have to be convinced that he should use a pyrometer; he must be convinced that he is going to buy the best pyrometer equipment for his requirements.

When I compare the average metallurgist or steel hardener of to-day with the same man of ten years ago, it is true that I may do an injustice to the men associated with a few of the larger companies where the advantages of pyrometers were appreciated at that time, but these plants were few and far between and it must be realized that I am speaking generally and of the average conditions of ten years ago and of to-day.

The old methods of measuring temperature by the expansion or fusing points of clay, by the expansion or contraction of metals, and by numerous other methods have largely been eliminated to-day and we have practically only two methods of measuring high temperatures. The thermo-electric pyrometer embraces either a thermo-couple inserted directly in the heat, or in the form of a radiation pyrometer with the thermo-couple heated by the furnace rays; secondary the optical pyrometer, in which a color comparison of an incandescent body and the steel under treatment is made. The optical pyrometer is used only portably as this instrument is not suitable for permanent installation or for automatically recording temperature. It is used quite extensively where it is necessary to focus on a particular piece of steel in a furnace to secure its temperature, or where excessively high temperatures are measured, around 3,000° Fahr. or 1,600° Cent., where a thermo-electric pyrometer is not suitable.

Optical Pyrometers

The optical pyrometer as generally used compares the incandescent filament of an electric lamp bulb with the luminosity of the steel under treatment. A milli-ammeter is used to measure the current passing through the lamp; the more current the brighter the filament and the greater the number of milli-amperes indicated on the meter. By turning a rheostat the amount of current passing through the lamp can be adjusted. When the color of the lamp filament blends with the piece of steel under treatment it is assumed that the two are at the same temperature. The indications on the milli-ammeter are then read off and by a conversion table the actual degrees Fahrenheit or Centigrade are secured.

Other forms of optical pyrometers compare the flame of a small oil or kerosene lamp or the color of multi-colored lens with the steel which is being heat-treated.

Having referred to this method of measuring temperature by an optical pyrometer, which has been used to some extent for twenty years or more, and the use of which is still limited, I can take up the thermo-electric pyrometer, which is almost universally used to-day.

I think that almost everyone understands that a thermo-electric pyrometer consists of a thermo-couple, a measuring instrument, and the leads connecting the thermo-couple and the meter. The thermo-couple is formed of two dissimilar metals, usually drawn into wire and with one pair of ends twisted together. When this junction is heated it generates a small current of electricity which can be measured on a milli-voltmeter.

It is true that a thermo-couple produces current, dependent on the temperature of the twisted junction extending into the furnace, known as the hot end, and the opposite end outside the furnace, known as the cold end or cold junction. It is at these ends that the leads running to the meter are joined to the thermo-couple. In accurately measuring temperature with a thermo-couple it is therefore essential that the cold junction be maintained at a known fixed and uniform temperature, which may be 75° Fahr. or any other temperature. If the cold junction of a thermo-couple is at 75° Fahr. and the hot junction in the furnace is at 1,400° Fahr., the actual millivoltage generated is equivalent to the difference in temperature between the hot end and the cold end of the thermo-couple, equivalent to 1325° Fahr. If we heat this cold junction to 100° Fahr. we will then only have a millivoltage produced by the thermo-couple equivalent to the difference in temperature of 1300° Fahr. instead of 1325° Fahr. as previously cited.

The effect of heating the cold junction of a base metal thermo-couple is such that with a rise in temperature of the cold junction of 25° Fahr. the instrument will read approximately 25° low. With a platinum thermo-couple this error is approximately one-half. In other words, with a platinum couple, the error would amount to only approximately 12° Fahr. for a rise in temperature of the cold junction of 25° Fahr. above normal.

In the use of any thermo-electric pyrometer it is essential that this point be realized, because far too many thermo-electric pyrometers are still in use to-day with the cold junction of the thermo-couple located right above a furnace and subject to constant changes in temperature and to probably a normal temperature of not less than 200° Fahr.

Assuming that the pointer on the instrument is set at 75° Fahr., such an instrument is actually reading 125° Fahr. too low. Of course, if the user of the instrument only realizes this fact which I have brought out, he will set the pointer of his instrument for the proper cold junction temperature 200° Fahr. instead of that usually adopted in supplying the pyrometer, 75° Fahr.

All modern pyrometers are equipped with zero adjusters which permit of setting the pointer to any desired cold junc-

*By courtesy of National Safety Council.

tion temperature and this point can be readily taken care of. Unfortunately in the case I have mentioned above where a thermo-couple is located just above the furnace, when the furnace is first started up, the temperature of the thermo-couple inside might attain 1400° Fahr. and the cold junction outside will have only reached 100° Fahr.; after the furnace has been run six hours the heat radiation from the crown of the furnace may be such that the cold junction temperature will reach 200° Fahr. In consequence, the pyrometer is reading 100° lower than it did formerly for exactly the same temperature in the furnace. In consequence, the operator, in order to make the pyrometer read the desired temperature, 1400° Fahr., is actually carrying 1500° Fahr. in the furnace when actually exactly the same temperature existed.

I hope I have made this point clear, as it is of the utmost importance if accurate temperature measurements are to be secured with a thermo-electric pyrometer.

Cold Junction Compensation

There are a number of ways in which we to-day overcome this course of error due to changes in temperature of the cold junction of the thermo-couple. First, we can supply compensating leads, as they are called, consisting of material the same as that forming the thermo-couple, which will remove the cold junction to some distant point where the temperature will be constant. These compensating leads can be selected of material the same as the thermo-couples or of the other alloys which will offset the effect of change in temperature at the cold end of the thermo-couple. If we run these compensating leads to some point near the floor in the heat treating room the temperature will probably vary from 60° to 110° Fahr. from winter to summer, or a possible error of 50° Fahr. where a base metal thermo-couple is used.

There are several ways in which we can further reduce this possible error. First, we can run the compensating leads into a pipe driven into the ground for some 10 feet and at the bottom of this pipe we make our junction with the copper leads running to the instrument. The cold junction is now in the ground where the changes from winter to summer under usual conditions vary 5° Fahr.

In using this method it is very desirable to use two pipes, the outer and larger one welded to a point at the end to drive easily into the ground. The inner pipe welded tight at the end can be slipped into the outer pipe. It is possible to split the outer pipe in driving and in consequence water may enter.

By using a second interior pipe this second pipe can be slipped down in the larger outer pipe and it is not under any strain in driving and can be easily made water-tight. The compensating leads for placing in the ground should have moistureproof insulation to prevent any danger of short circuiting or grounding on account of moisture. Where these precautions are taken this is an excellent method of maintaining a constant cold junction temperature.

Another common method is to place the cold end of the compensating leads in a compensating box, which consists of a thermostat and lamps or heating units. By means of the thermostat it is possible to maintain any desired temperature usually up to 150° Fahr. within a limit of + or — 2° Fahr. The ordinary compensating box is designed to take care of as many as 20 thermo-couples, which are led into one compensating box, and this affords an easy method of maintaining a constant temperature.

In using the compensating box it is essential that the thermostat be set with the graduated temperature scale at a temperature higher than that which will be attained in the room in which the compensating box is located; for example, if the room will attain a maximum temperature in summer of 120° Fahr., it is common practice to set the compensating box at 125° Fahr. and the pointer on the scale of the pyrometers which are operated by the various thermo-couples connected through this compensating box will be set likewise for 125° Fahr. on the scale.

The compensating leads from the thermo-couples can be also run to the instrument, which may be located in the room subject to variation in temperature from probably 70° to 100° Fahr. from winter to summer. In this case it is possible to have an error of as much as 30° Fahr.

Thermo-electric pyrometers are now supplied with automatic compensating means at the instrument so that, provided the compensating leads are run to the instrument, automatic compensation takes place to overcome changes in temperature at the instrument itself. This compensation can be readily incorporated in the thermo-electric pyrometers through a shunt of large temperature coefficient, which will be materially affected with atmospheric changes in temperature.

Base Metal Thermo-Couples

I have referred previously to the use of thermo-couples formed of base metal and of platinum wire. Base metal thermo-couples are almost universally used for measuring temperatures to 2000° Fahr. or 1100° Cent. These base thermo-couples for temperatures up to 1200° Fahr. or 650° Cent. are usually formed with one wire of constantan, a nickel copper alloy, and the other a pure iron. This form of thermo-couple is advantageous for use in a reducing atmosphere within the above temperature limits. For temperatures above 1200° Fahr.. up to 2000° Fahr., equivalent to 650° Cent. or to 1100° Cent., a thermo-couple formed of one wire of 90 per cent. nickel and 10 per cent. chrome and other wire of 98 per cent. nickel with balance manganese, silicon and aluminum, would give the most satisfactory service.

Base metal thermo-couples as supplied to-day are furnished in all diameters from .01 in. up to ¼ in. in diameter; sensitive thermo-couples of wire .01 in. in diameter can be used experimentally to advantage in testing the temperature of the surfaces of metal, particularly at moderate temperatures, whereas thermo-couples formed of wire ⅛ in. or ¼ in. diameter are better suited for constant service in large heat-treating furnaces.

Platinum Thermo-Couples

Where we have to measure temperatures from 2000° Fahr. or 1100° Cent. up to a maximum of 3000° Fahr. or 1600° Cent., it is best to use a platinum rhodium thermo-couple, one wire being of pure platinum and the other platinum 90 per cent. and rhodium 10 per cent. The wires forming this thermo-couple are usually .02 in. in diameter. A platinum rhodium thermo-couple gives very satisfactory life even under severe service at temperatures up to 2500° to 2600° Fahr., provided the wires are suitably protected from the gases with a tube of porcelain or silica, which is impervious to gases. These tubes are in turn protected with a tube of graphite, carborundum, fire brick or other suitable material which serves to protect the fragile porcelain or silica tube from mechanical injury and introduces a slight lag to prevent breakage through contraction and expansion due to sudden changes in temperature.

While it is of the utmost importance to properly protect a platinum rhodium thermo-couple to exclude gases which very actively attack the platinum, it is equally desirable to properly protect a base metal thermo-couple if maximum life is to be secured. The usual method of protecting a thermo-couple for temperatures up to 1400° Fahr. (750° Cent.) or below, is to use a common wrought iron pipe with the lower end plugged or welded. The life of common wrought iron pipe can be increased to some extent by calorizing, a process developed by the General Electric Company of impregnating the pipe with an aluminum oxide.

A material increase in the life of base metal thermo-couples for temperatures above 1400° Fahr. or 750° Cent. is secured by the use of protecting tubes of nickel chromium or of a special alloy which we have recently adopted in our resisteat tube, as they are trade-marked. The nickel chromium tubes withstand to a satisfactory extent normal use in heat-treating furnaces where the temperature does not exceed 1600° Fahr., but for the most common conditions and where maximum life is secured this special alloy resisteat tube is given the best results.

To insulate the wires forming a thermo-couple from each other and from the protecting tube, it is common practice to use beads of porcelain or lavite, which are the most satisfactory for this service. Formerly asbestos tubing or string was used to insulate each wire and this was painted with a solution of sodium silicate and carborundum, but this form of insulation rapidly disintegrates at temperatures above 1000° Fahr. The porcelain or lavite insulation is most certainly to be recommended.

Standardized Voltage from Thermo-Couples

A platinum rhodium thermo-couple, on account of the care taken in the refining of the precious metals and the proper alloying, can be reproduced continuously with the same millivoltage. As new ingots are cast every few years from which this wire is drawn, it has been possible to carefully duplicate these ingots so that the millivoltage is reproduced within some 5° Fahr. of the millivoltage produced by a previous lot.

With base metal thermo-couples it has been extremely difficult to select wires which will accurately reproduce the standard millivoltage of a certain base metal thermo-couple. It seems that the limit in this respect is approximately 15° + or — or a total possible error of 30° Fahr. We have, however, made some progress through special care in selecting wire producing the desired millivoltage, and it is possible for us today to supply wire for thermo-couples with an accuracy within 10° Fahr. + or —.

Where extreme accuracy is required it is possible to shunt the thermo-couples to a definite or standard millivoltage by reducing the voltage produced by the thermo-couple by some 2 millivolts. With this method it is possible to standardize any thermo-couple with extreme precision and an accuracy within + or — 4° Fahr. can be easily obtained.

A shunted thermo-couple can be used to advantage where the immersion of the thermo-couple at any time provided it exceed 18 in. For unusual immersions where the thermo-couple must protect, for example, several feet inside the furnace, the unshunted thermo-couple is preferable. Where the shunted thermo-couple is used it has the advantage that it is possible to restandardize this thermo-couple at any time provided it falls off in voltage. With the unshunted thermo-couples, should this occur, it must be either junked or shortened if this is possible.

The shunted thermo-couple has the disadvantage that the shunt may be broken accidentally or through mechanical injury. Both the shunted and unshunted thermo-couples have their advantages and disadvantages and each has its uses.

There are two common methods of measuring the voltage produced by the thermo-couple, the milli-voltmeter method and the potentiometer method.

The Milli-Voltmeter Method of Measuring Temperature

The milli-voltmeter method has been in use for a great many years. The original milli-voltmeters were constructed with a movable element swinging in the air-gap of a permanent magnet and hung by a fine suspension wire. As a platinum thermo-couple produces some twenty thousandths of a volt for 300° Fahr. and a base metal thermo-couple some 40 thousandths of a volt for 3000° Fahr., the usual temperature scale, the internal resistance of an instrument is dependent on the type of thermo-couple used and the voltage is consequently available.

These suspension type instruments, which were largely made in France, England and Germany some twenty or more years ago, had an internal resistance of some 300 to 600 ohms with a platinum thermo-couple with full scale of 20 millivolts. On account of the delicate construction of these instruments and the continual breakage of the suspension wires, certain manufacturers in this country produced a low resistance form of milli-voltmeter pyrometer consisting of the standard form of switchboard or portable milli-voltmeter used with a shunt as an ammeter. This instrument usually had from 3 to 5 ohms internal resistance. While it was true that such an instrument was exceedingly robust and could be handled without likelihood of injury, it was equally true that the accuracy of such an instrument was exceedingly poor on account of the low internal resistance of the instrument. Frequently the total resistance of the thermo-couple and the leads connected to such an instrument might vary from a total of 1 ohm to 2 ohms, affecting the actual readings of the instruments as much as 20 per cent.

If an instrument of this kind was calibrated for a 3 ft. thermo-couple of the usual ⅛ in. wire and it had later to be used with a 4 ft. thermo-couple, unless the instrument was re-calibrated it read 20° too low. If the instrument was calibrated from 25 ft. double conductor No. 12 gauge copper leads and it had later to be located at a greater distance where 75 ft. of the above leads were required, the instrument read some 18° Fahr. too low. Under such conditions it was absolutely impossible to secure any precision in measuring temperature.

In the past five or six years high resistance milli-voltmeter pyrometers have been developed with an internal resistance with a platinum couple of as high as 600 ohms or with a base metal thermo-couple as high as 1,200 ohms, which have a standard double pivoted construction used in the ordinary low-resistance instrument, eliminating the suspension wires. By re-designing the standard instrument, by lightening the movable element and narrowing the air-gap, it has been possible to attain this high resistance. This high resistance can be attained, first, as I have outlined above, by the changes in the design of the instrument and also in part by the use of an aluminum alloy for the winding in the movable elements. This decreases the weight of the movable element 100 per cent.

Where an instrument of 600 ohms resistance is used, a change in line resistance from 5 ft. to 500 ft., which is naturally very excessive, will affect the readings of the pyrometer only 4° Fahr. where the scale is graduated to 2000° Fahr. Any likely change in the length of the thermo-couple has absolutely no effect on the readings of such a pyrometer.

In the last couple of years, instruments have been brought out in which the effect of line resistance can be entirely eliminated by balancing the voltage of the thermo-couples against that of another source of emf such as a dry cell. Usually an adjustable resistance is installed for a total of 15 ohms, and any variation in line resistance can be compensated for in this type of instrument up to a total of 15 ohms. After this adjustment has been made, the instrument is direct reading and independent of line resistance.

Messrs. Harrison and Foote, of the Bureau of Standards, Washington, have recently hit upon a method of accomplishing this result by using the voltage of the thermo-couple itself and by simply the depression of a key and the turning of a rheostat, adjustment can be made for any line resistance up to 15 ohms. This new instrument requires no dry cell or standard cell as a source of emf. The instrument is similar to the ordinary milli-voltmeter in appearance, with the addition of the small key and resistance knob. The operator has only to read the temperature in the usual way. He presses the key, and if the reading is any different from that which was previously observed he turns the resistance knob until there is no change, whether the key is depressed or not. The instrument has then been adjusted for line resistance, which may be any amount whatsoever up to 15 ohms, equivalent to many miles of copper leads.

We have secured the exclusive license from Messrs. Harrison and Foote for the use of this construction in connection with our milli-voltmeters in this and foreign countries, and there is no question in my mind but that it is a radical step forward in the milli-voltmeter method of measuring temperature, for it has the following radical advantages:

As in the ordinary milli-voltmeter the instrument is direct reading throughout the whole scale range. The instrument is independent of line resistance up to a total of 15 ohms and what little temperature co-efficient exists in the ordinary high-resistance milli-voltmeter is balanced out in this instrument. Accuracy in calibration of an instrument of this kind can be guaranteed within one-tenth of a milli-volt equivalent on the base metal scale of 4° Fahr.

The Potentiometer Method

The potentiometer method of measuring the voltage produced by a thermo-couple has been quite extensively adopted in the past six or eight years where extreme precision is required. The potentiometer method differs from the milli-voltmeter method in that the milli-voltmeter uses the current produced by the thermo-couple to deflect the instrument. The potentiometer opposes the current of the thermo-couple to that of a dry cell and the dry cell current, equivalent to that of the thermo-couple, is measured.

To be continued

Hamilton.—The general traffic manager of the Canada Steamship Lines has written to the Hamilton Harbor Commissioners to the effect that they can not expect a better boat service until the beach canal is widened and deepened.

WHAT OUR READERS THINK AND DO

Here is the First Answer to Letter from H.H.J.

From the viewpoint of one of our staff.

LACK of space in our last issue precluded our commenting upon the letter from H. H. J. which appeared therein. Our correspondent gave expression to the opinion that in the majority of machine shops apprentices and workmen are deliberately discouraged by the foremen in any efforts they might make to increase their knowledge by study in their spare time or to promote the interests of their employers by making suggestions which might lead to improved methods in the shop.

If the premises upon which H. H. J. bases his complaint are true, he would, undoubtedly, be justified in claiming that a most lamentable state of affairs exists and one which cannot be too quickly remedied.

But are conditions in the machine shops of Toronto generally such as H. H. J. claims them to be? Surely the deductions he draws from his own experiences, which may possibly have been unfortunate and exceptional, cannot be lightly accepted as typical of machine shops generally.

Are 75 per cent. of the plants in Toronto mismanaged? For this is the present conditions of affairs if we are to take our correspondent's statements at their face value. True, he does not say this in so many words, he does not use the word mismanage, but could any milder term be used to describe a plant in which the superintendent deliberately slights the apprentice or workman who is trying to get ahead, in which the foreman goes out of his way to belittle the advantages of study and of correspondence schools, in which any suggestion which is made for the improvement of shop methods is deliberately ignored and even refused a moment's consideration, or if such suggestion should be acted upon the credit for it is filched by the foreman, and the workman making it derives no benefit whatever from it. Are these the conditions existing generally in the machine shops of Toronto? We should be sorry to have to think that such was the case.

Again, are there a large number of superintendents and foremen who are only able to retain their positions by appropriating the ideas of their workmen and passing them off as their own?

Is it a fact that in the majority of cases a workman has only to show a little unusual ability in the adoption and practice of the most up-to-date methods when the foreman at once looks upon him as a dangerous rival, and by making things generally uncomfortable forces him to quit his job? Can such a condition of affairs be general? H. H. J. claims it is "a true fact and can be proved up to the hilt."

The writer's own experience does not coincide with this statement. It would be foolish of course to contend that no foreman has ever attempted to discourage the enthusiastic workman under him or that every superintendent has always conscientiously investigated every suggestion made to him; there are backward and pigheaded foremen in the machine shop, as indeed there are in every line of business, but the writer's experience has been that they are the exception and not the rule. The majority of firms are only too anxious to welcome suggestions from their employees, and the suggestion box is a feature in the majority of shops. H. H. J. suggests that the untoward conditions he mentions may be remedied by the offer of cash prizes for any improvements in the speeding up of production. This is frequently done. Only last week in the mechanical department responsible for the production of this journal three prizes were awarded to employees for suggestions which would lead to improvement in shop methods. So anxious are some firms not to discourage suggestions from the least of their employees that they will take the trouble to treat seriously a suggestion of any kind, even if it be one that is obviously impossible of acceptance, explaining the reasons for its non-adoption and expressing a hope that future suggestions may be possible of acceptation.

A point to be guarded against by enthusiastic apprentices and young workmen is attaching too great an importance to their own ideas and failure to remember that the same idea may have occurred to others before them, and that experience may have shown that it was unworkable. The writer has made many suggestions in his time, but when he looks back and remembers how splendid they appeared to him at the time, but how weak and puny they proved to be upon investigation, he has to laugh at his own expense. Of course he felt aggrieved at the time that they were not acted upon and was inclined to harbor opinions regarding foremen, superintendents, managers, etc, similar to those of H. H. J., but now in his saner moments he realizes that certain factors entered into the subject of which he had then never dreamt.

On the other hand he can recall suggestions which, after due discussion and consideration were accepted and adopted. In such cases he received no extra remuneration, that is to say, directly, but his efforts broadened his ideas and enlarged the scope of his daily work which in due course brought him a better salary. True, once in a while a snag will be encountered in the shape of a grumpy, grouchy foreman, but this does not hold true, in the writer's opinion, at least, of the majority of the shops in Toronto or elsewhere.

The very fact, however, that such an opinion exists shows that the subject is well worthy of ventilation, and CANADIAN MACHINERY will welcome expressions of opinion on the subject from its readers on both sides of the question. If such ventilation should result in the dissipation of any such feelings as those expressed by our correspondent, such a discussion would not have been in vain.

THEN THE TROUBLE STARTED

Judge (to negro who had been beaten up by an Irishman): "What were you doing when the prisoner attacked you?"

Negro: "I weren't doin' nothin', yer honah."

Judge: "You must have been doing something or the prisoner would not have attacked you."

Negro: "I weren't doing nothin', yer honah. I were just going along de street singing."

Judge: "What were you singing?"

Negro: "Ireland must be heaven, for my mother came from there."

DEVELOPMENTS IN SHOP EQUIPMENT

SEMI-AUTOMATIC GRINDER ALL GEAR DRILL PRESS

The Woods Engineering Company, of Alliance, Ohio, have recently placed on the market a new machine known as a semi-automatic wide wheel grinder. Patents are pending on this machine.

Following is its general description:

The machine is semi-automatic in its movements, the operator being required to load and unload the work only.

The cross feed is accomplished by a rocking motion of the head and tail stocks. The head and tail stocks are movably mounted on a square shaft, the shaft having journals at the ends which operate in bronze bushed pedestal type bearings. Clamped to this shaft is an arm which carries the mechanism for making the diameter adjustments in grinding. This arm is shown at the right side of the machine in the cut, the 6 in. hand wheel standing in a convenient position for the operator. This being the only hand wheel, the manual labor in operating the machine is reduced to a minimum.

A shaft running through the housing parallel with the square shaft carries on the right hand end a cam that controls the movement of the arm connected to the square shaft and governs the movement of the work to the grinding wheel. This cam shaft has six speeds, ranging from three revolutions in one minute to one revolution in three minutes. One revolution of the cam makes a completed job.

In operating the machine this cam shaft is kept running continuously, which sets the pace for the operator, or if it is necessary the trip can be set to trip the feed at the completion of each job, or the feed can be tripped by the operator at any time during the revolution of the cam.

At the left hand end of the cam shaft is a cam that controls the clutch pulley driving the work. These two cams are timed with each other so that when the work moves up to the grinding wheel the clutch pulley is engaged and the work starts rotating just before the work comes in contact with the grinding wheel. When the grinding cycle is completed and the work moves away from the wheel it stops rotating and comes back to a position for reloading.

There are six speeds for the work obtained by a set of cone pulleys inside the base of the machine. The speed changes for both the work and cam shaft are changed by the handles projecting through the front of the machine as shown in the cut.

The grinding wheel is mounted on the spindle between the bearings and is driven by two 4 in. belts from a motor mounted on the base of the grinding wheel head. This head swivels on a central stud for grinding taper work. The grinding wheels are carried on wheel centres, and in changing wheels it is not necessary to break the adjustments of the spindle bearings or remove any pulleys, the wheel centres having a bore large enough to pass over all other parts on the spindle.

For truing the grinding wheel a frame is pivoted on the casting which forms the wheel guard. This frame carries a dovetail slide and a carriage with a cross-feed movement carries the diamond holder.

In truing the wheel the work centres are lowered by pulling back the hardened pin that bears on the cam, then the truing frame swings down to a positive stop that brings the diamond on the same plane as the work contact.

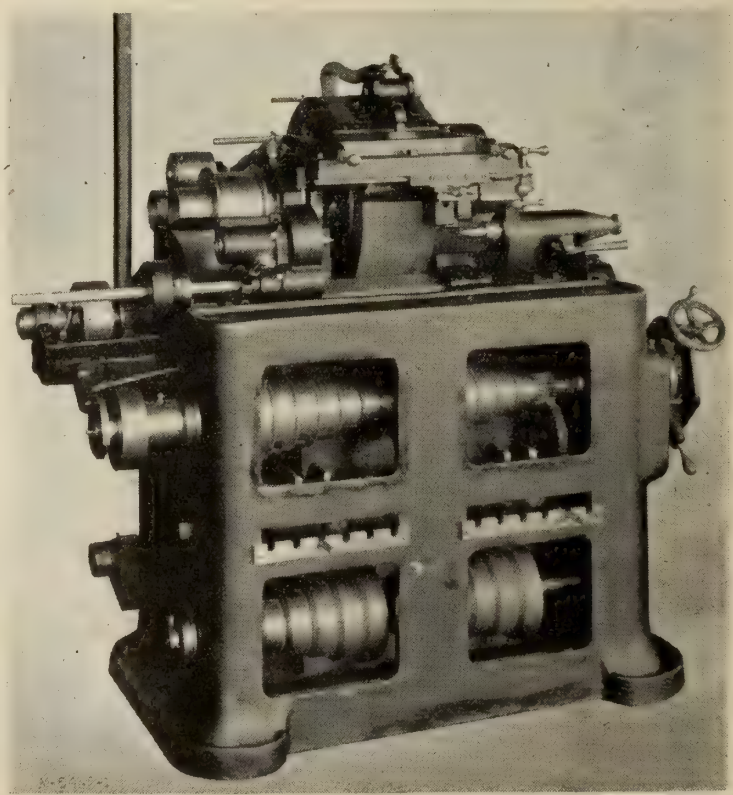
All working parts are designed to be protected from dust and grit.

The Bed

The bed is of complete box section strongly ribbed with a solid bottom. There are three pads that give a three-point bearing on floor or foundation, one pad being placed under the wheel spindle, the other two at the ends of the work carrier. The bed is divided into two sections, one of large size that forms the reservoir for grinding compound, the other containing the speed changes for cam feed and work speeds.

The Grinding Head

The grinding head is a massive casting having a base large enough to accommodate the driving motor. The motor shaft is extended on both sides, and the spindle drive is from pulleys on the ends of motor shaft, direct to the grinding spindle. Either a ten or fifteen horse-power motor is furnished as customer's work requires. Individual automatic belt tighteners running on roller bearings are provided for the spindle drive belts. The grinding head swivels on a large stud



FRONT VIEW OF GRINDER SHOWING CONE PULLEYS INSIDE MACHINE.

and has a sensitive adjustment for setting to grind taper work up to 2 in. taper per foot. The spindle is 3¾ in. diameter and is made of .70 carbon high chrome-nickel alloy steel, heat treated, and runs in bronze bearings tapering on the outside and adjustable.

The headstock is gear driven, the gears being well guarded. A shifting clutch is provided for starting and stopping the work at such times as is necessary. The dead centre is No. 4 Morse taper.

The tailstock has a quick-acting centre and the spring tension is adjusted by a knurled nut on the end of barrel. The tail centre has a No. 4 Morse taper.

The Diamond Wheel Truing Device

The diamond wheel truing device is built up of a swinging frame with a dovetail guiding surface and a sliding carriage that has a compound slide carrying the diamond. To true the wheel with a straight face, the upper dovetail of the compound slide is held rigid with binding bolts. This leaves the longitudinal and cross slides free for operating. When it is desired to true the wheel to a special shape for form grinding, the upper dovetail of the compound slide is released and a hardened steel form of the desired shape is inserted in position with finger bearing on the form in proper relation with the grinding wheel. The spring tension is adjusted, and by operating the longitudinal feed the wheel is trued to the shape of the form.

A large capacity centrifugal pump is provided that delivers an abundant supply of coolant to the work, and is always primed.

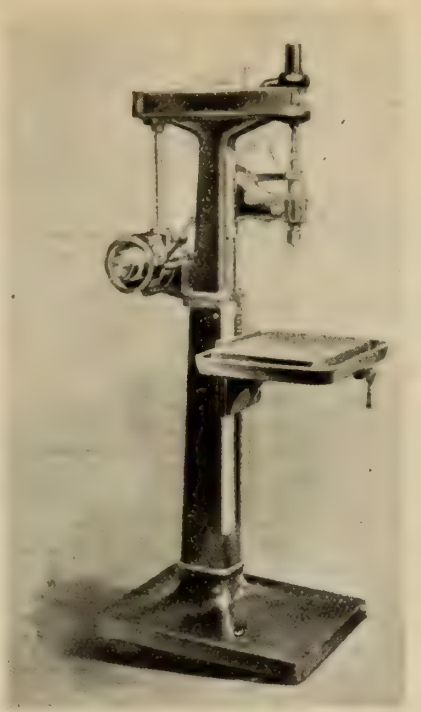
The machine is furnished complete with a ten or fifteen horsepower motor and mounter starter. all belting in place. diamond wheel truing device with diamond, one steady rest, one grinding wheel with wheel centre, job crane with hoist for removing wheel spindle and necessary wrenches.

ALL GEAR DRILL PRESS

The Danber-Kratsch Co., of Oshkosk, Wis., have recently placed on the market a new upright drill press, known as their "Wisconsin" 20-inch All Gear Driven Upright Drill Press.

The machine is shown in the accompanying illustration.

As will be seen from the cut, the old type of cone drive has been discarded and replaced by a geared head single pulley drive. This eliminates all shifting of belts to get the different speed changes required. The drive for the machine consists of four pair of semi-steel and rawhide gears. These gears are engaged or disengaged through friction clutches, by means of the single operating lever on the left-hand side of the machine. There are no sliding gears in the gear box, so that the speeds may be instantly changed from one to another, without shock or jar, by a single movement of the clutch lever, while the machine is running at full speed. The clutch gears in gear box are mounted on roller bearings, so that it is unnecessary to run gears in an oil



GENERAL VIEW OF THE DRILL PRESS.

bath. The end bearings of gear shafts are bronze bushed, and are lubricated from the outside by means of oil cups. The drive from gear box to spindle is through a pair of bevel gears.

The column is reinforced by the straight back-strut, which supports the back end of the gear box, and also relieves the column of all bending stress induced by the pressure of the drill. The lower cylindrical end of the column is ground to carry the table support.

The base is made heavy enough to properly support the machine, and also provides space for any work to be drilled on it. Base has two Tee slots for bolting work to it.

The table support is made in the form of a box section. This is clamped on the column by a single clamping screw, operated by means of a hand lever. The table has four Tee slots. The centre hole in the table lines up exactly with the drill spindle, so that a boring bar may be used in spindle, if desired, for boring large holes. Table is clamped in its support by a conveniently-located hand lever. The elevating screw, for raising and lowering the table, is placed at the back of the machine, so that the table may be swung at right angles, entirely out of the way of the column on either side, for drilling work on the base.

Both table and base are provided with large oil trough for properly taking care of cutting lubricant. Balance weights for both spindle and sliding head are placed between column and back-strut, and run on guides, so that they are easily accessible. The machine is equipped with a sliding head and all geared power feed. Also has hand-wheel feed and a large pilot wheel for quick return of spindle or sensitive feed for small drills. The spindle is made of high-carbon steel, and has ball thrust bearing at its lower end. It has four changes of feed for each spindle speed. There are four spindle speeds on the machine shown. If desired, a two-speed friction counter-shaft may be furnished, this giving eight spindle speeds.

All gears used on the machine are properly covered to keep out dirt and to protect the operator. Machine may be equipped with tapping attachment, if desired.

Tariffs and Politics

WITH the growing strength of the Farmers' political party not only in Ontario, but in the Federal arena, this country is going to face the tariff proposition in a very acute form before many months have passed. Unfortunately there seems to be no alternative to making the tariff a party issue.

The tariff should be no more a party issue than the decision made by a council to pave the front street with asphalt rather than macadam.

The business of framing tariff laws is a complicated, scientific business, closely related to finances, industrials and the general living conditions of the people. No political party has yet existed in Canada or any other country that could take a view sufficiently broad-minded to adjust tariff conditions satisfactorily. Very often those who managed to crowd into the front trench on a tariff fight are the extremists, and the great mass in the moderate ranks have little chance to be heard.

We do not believe, with all due respect to the wisdom of the farmers, that they are capable of handling a tariff for the Dominion by themselves. We do not claim that any other class has the necessary knowledge. It needs men from many walks of life. Tariff revision should be a constant rather than a spasmodic study. Canada has a great and a growing industrial section. This section has no desire to dominate the situation, but it is of sufficient importance to be worthy of every consideration.

Do You Answer Letters?

WHY is it that some people do not answer letters? A manufacturer in an Ontario city wanted to secure a lot of information regarding the scale of wages paid to a certain trade, and the hours worked, in other centres. He took the very sensible course of writing a letter to each place explaining what he wanted to know, and why. He stated that his wage contract with his men was running out very shortly, and he wanted to gather information that would give him a line on the current rate of wages in other places.

Well, he sent out in all 126 letters to as many different firms. Along with the query went a stamped, addressed envelope to use for the reply. Out of the total 126 he got 24 replies.

Why? It's a hard matter to explain.

It takes very little brain power to take a man's letter asking for information and cast it into the waste paper basket. In fact it's no trick at all to do that. It requires hardly any more or less to take the letter and stick it in some pigeon hole and promptly forget about it.

The real trick is this: "Here's a man asking for information about a matter that interests me just as much as it does him. Wonder if I could give him a lift here and then some time in the future ask him for a copy of the information he secured.. My wage scale will be running out some day and it will be very handy to know what is being paid in the other centres in our line of business."

Unless you have some very good reason, do not neglect the answering of a letter asking for information. It is just the same as though a man came into your office and asked you a question, and your reply was to keep right on with your work without even recognizing that he was in the room.

Especially should this be made a hard and fast rule if your establishment is selling goods to customers at a distance. Trade commissioners from other countries, acting there on behalf of Canada, state plainly that Canadians, in many cases, are not careful to attend promptly to inquiries, and in this way a very poor impression is formed of the concern and its methods. All the foreign buyer knows of you is that he wrote a letter and it was either ignored or greatly delayed in answer.

A little work, a little care and determination in this regard makes a great business investment.

The Use of Molybdenum

EVERY now and then the daily press heralds some new and revolutionary discovery with a blaze of publicity, which dies down and disappears from sight, when exposed to the cold showers of investigation.

The latest flurry in this line is the announcement of a new steel, or in other words, of the use of a new alloy in the making of steel, which will eliminate all others for this purpose. From this distance, and with the meagre information at hand, it is impossible to say anything as to the reliability of these claims. This much can be said, however, that the alloy in question, molybdenum, is not new, neither is its use in the making of steel. The most commonly used alloys are nickel, chromium, tungsten, vanadium and manganese, and these are used in various quantities to produce qualities of hardness and toughness, making it specially suitable for armored plate. It does not crack when pierced by a projectile. Chromium is used in steel for making safes, and owing to the shock-resisting properties it gives to the steel, it is suitable for heavy crushing machinery. Vanadium gives more ductility, increasing the elastic limit, making it good for springs, axles, etc., subject to repeated stresses. Sometimes both chrome and vanadium are combined. Manganese in the right proportion, great ductility and hardness are obtained. Tungsten is mostly used in cutting tools, for high speed work. Molybdenum possesses the same qualities as tungsten, with the advantage of requiring less of the alloy to be used than when tungsten is employed. There have been difficulties of manufacture which have caused it to be less employed than the others. It is probably these difficulties which Prof. Arnold has overcome.

Baldwin's Ltd. to Add Open Hearth Equipment

A REPRESENTATIVE of CANADIAN MACHINERY has recently been given the opportunity of inspecting the construction work now under way at the plant of Messrs. Baldwin's Ltd., at Ashbridge's Ba, Toronto. This firm are using, as a nucleus for their Canadian plant, the site and building of the British Forgings, Ltd., purchased some few months ago from the Imperial Munitions Board, under which it was operated for the production of shell forgings during the war. And while the plant site serves admirably for the new development and while much of the equipment can be well utilized to advantage, much new equipment has to be built, and buildings erected for the making of the various steel products contemplated, viz., tin plate, black plate, terne plate, castings and forgings.

At the present time three new buildings, forming one unit of the plate mills, are in the course of erection. Each of these buildings will be 800 feet long and 80 feet wide. The first two will contain the furnaces and rolling mill equipment while the third will be used as a finishing plant containing the tinning and galvanizing equipment, together with that necessary for the making of terne plate. Pickling, annealing and cold rolling will also be done in this latter portion of the building.

Doing Rapid Work

At the present time about 500 men are employed around the plant, the major portion of them working on the foundation work now under way. This preliminary work is rapidly nearing completion and an enviable record for rapid construction has been made by the contractors, Roger Miller & Sons. The work was started in October and, when seen by the writer, the mill foundations were practically completed for the first unit and the footings for the building steel were all in place. The poor character of the ground, part of the filled in area at Ashbridge's Bay, has necessitated considerable piling and for the excavation for the mill foundations sheet piling has been necessary.

It is expected that the structural steel for the buildings will shortly be erected by the Canadian Allis-Chalmers Company who have the contract for its erection and fabrication.

In connection with the manufacture of the equipment which will be needed for the various activities of the firm, Mr. S. R. Cound, general manager, emphasized the fact that the major portion of it would be made in Canada and to their own plans and specifications. Only those portions of it which cannot be obtained with ease and promptness will be imported and of this the tinning and pickling equipment forms the major part.

Much of this equipment is being manufactured by Messrs. Baldwin's themselves, the various portions of the plant being admirably adapted to the purpose. The pattern machine shops and foundry are working on rolling mill equipment; screw pins and boxes for the roll housings, together with the housings themselves, are being machined at the present time, while patterns of all descriptions are ready, waiting their turn for casting as the work progresses. In fact there is no part of the plant which can be utilized standing idle. This all goes to show how quickly the management have turned everything available to the development of the new industry.

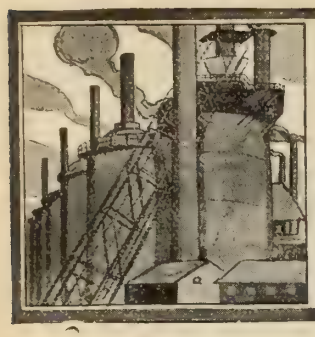
In connection with the making of sheet and tin plate, it is essential that the steel be of a certain quality. The securing of steel of the proper analysis and quality is one of the most difficult problems to be met with in the tin plate industry, and at the present time Messrs. Baldwin's Ltd., are working on the rolling mill and open hearth equipment necessary for the making of the bar stock for black plate and tin plate.

It is not anticipated that the present equipment of ten electric furnaces, each of six tons capacity and of the Heroult type, will be used for this purpose, owing to their higher cost of operation and open hearth furnaces will be laid down in consequence.

Seeing that the electric furnaces could not be used to advantage in the manufacture of plate, a new industry, for Toronto, has been created. It is purposed to utilize the electric furnaces in the making of steel castings to meet the requirements of the trade in Toronto and adjacent territory.

Foundry In Operation

The foundry during our visit was in full operation, about thirty to forty men were at work on the foundry floor. Steel castings for the rolling mill equipment were being made, one of them which had just been cast and which was being prepared for the machine shop, weighing six and one-half long tons. In the sand being prepared for the next cast was one of the heavy rolling mill standards which will weigh after machining in the neighborhood of 12 tons. In addition to meeting their own requirements, Messrs. Baldwin's are also handling custom work at the present time. Cast gears of accurate dimension and other intricate work has been cast. It is estimated that the foundry will be capable of turning out forty to sixty tons of steel castings per day when in full operation.



MARKET DEVELOPMENTS

Steel Shipments Not Over 65 per cent. Normal

Pittsburgh Does Not Look for Any Great Improvement Before March—Conditions Remain Much the Same as They Were During Period of the War—A Dull Scrap Market

IT is generally conceded that it will be March before there is any improvement in the steel situation, as far as the shipping of material to Canada is concerned, and it may be longer than that before shipments start to come through freely. The situation does not improve at this end, and at best it cannot be stated that firms having a very direct connection with the mills are getting anything better than 65 per cent. of their material across now.

The extent to which premiums are being paid can be gathered from the fact that plates, regarded for a long time as one of the weak spots in the market, have started to move and are now quite firmly established in the premium list in many places. Of course the premiums are paid for delivery, as it is still possible to book plate business at the 2.65 base price, but delivery will not be made until the third or fourth quarter in 1919. In such a case it often pays a firm well to go into the premium market and pay the higher prices for quick delivery.

War conditions are prevailing in the machine tool market. Deliveries seem to get a little more distant and uncertain each week. Canadians who have been in the machine tool centres of the States report that the firms there are hopelessly booked in many cases, and will not be able to improve their delivery schedule. Old Country dealers were counting on getting into the Canadian field, and shipments of machinery were to have been on the way by now. However, it may be some time before this can be done, as strikes and other problems have spoiled the plans of the makers.

One order that was placed this week included machinery that is not to be supplied until December of 1920, thus giving the dealers a splendid opportunity to give real service in such an order. This has long been a sore point with machinery houses, namely, that the Canadian manufacturer does not plan far enough ahead, and as a result every order he places is expected to be rushed through with delivery made at once.

Scrap markets are dull, with no changes made in quotations. There is a feeling that dealers and users will have to name higher figures in order to get those who are holding material to part with it.

HOLIDAY SEASON PUTS BRAKES ON THE BUSINESS IN MONTREAL

Special to CANADIAN MACHINERY.

MONTREAL, Dec. 25.—While every precaution is still exercised to conserve the available coal supply for industrial purposes, the situation is showing gradual improvement, and it is expected that before February the movement of coal will enable factories and railroads to resume normal activity. Fuel Controller Magrath has succeeded in having shipping restrictions removed, so that the movement of coal and coke from American points will be more regular from now on. This does not mean that every want of the consumer will be realized, as the regulating of distribution is still in the hands of the Government authorities, who retain the right to confiscate supplies for shipment to public utilities and essential industries, if this action is deemed necessary. Some little time must elapse before things are running smoothly, as previous seizures of coal will require adjusting, and the uncertain weather conditions are a factor affecting the situation. With the close of navigation, Montreal has taken on her usual winter appearance and harbor activities are reduced to making the final preparations for the closed season. The approaching holiday season has apparently been reflected in business, and a general disinterest that seems to pervade the trade at this season of the year. This condition is to be expected, we suppose, and indications point to a continuance of a rather listless market until the turn of the new year. There is still a steady demand for steel products, but dealers report difficulty in getting material through, although there is a steady progress toward improved conditions. Warehouse stocks are low and in some lines it is impossible to get any ahead, as consumers are waiting to take hold of material as soon as it arrives. This is especially noticeable in sheets and tubes of the usual sizes. Some odd sizes are still on hand. Dealers report a steady return to normal mill operations, but coal supplies are still of a conservative nature, and every care is still required in the use of coal. While the local market is operating at medium pressure, and producers are gradually resuming normal activity, there is a reluctance on the part of the latter to book future business. The opinion of dealers here appears to give assurance of the general report that early in the new year the tendency will be for a stronger market and probably advanced prices on those commodities in heavy demand. Local quotations are holding firm, and this firmness will likely continue over the quiet period.

Quiet Period Expected

Like other markets, the scrap situation is evidently controlled by an unseen influence, and as a result, dealers are undecided as to the early trend regarding prices. It is a fact that activity at present is confined to local movement and in small quantities, sufficient to cover immediate needs only. Dealers are looking forward to a quiet week and anticipate no change of importance until the first week of the new year. The only line that appears exceptionally

strong is that of machine cast, but dealers are satisfied to let the quotation of $24 stand as the nominal figure.

Delivery Still Poor

The feature of the machine tool situation is the improved demand that has arisen for used equipment, not that this is very heavy, but of sufficient volume to be of interest to the dealers. Generally this class of machinery can be secured in reasonable time, which is seldom the case with new tools, particularly when these are brought in from the States. There is a belief that higher prices will rule after the turn of the year.

BOOKING NEEDS A YEAR AHEAD NOW

Satisfactory Trade is Being Done in Machine Tools—Deliveries Do Not Improve

TORONTO.—"We are simply back where we were during the course of the war," stated one machine tool dealer to CANADIAN MACHINERY this week. "Then we had to go and explain to our customers why we could not get their orders filled. Now we have to do the same thing." This dealer has just returned from a survey of the American machine tool industry, and is of the opinion that production is not going to be any better from that source for some time. The shops are well filled with business; in fact, in some lines, they are booked for months to come, and offer nothing to the dealers here, even where delivery would be a great factor in the closing of a deal. Old Country lines that were expected to be on the market here before very long are in very little better shape. Strikes and delays have worked havoc with the turning out of machinery, and in this way there has been an additional delay in getting machinery ready for shipment to the trade in this country.

Dealers report a lot of business coming in for delivery during 1920. In one place, CANADIAN MACHINERY saw orders this morning running into some tall figures, and the last machine on the list was not to be delivered until 1920. "That is the way machinery should be planned for," remarked the dealer who had booked the business. "When we can get some of our larger manufacturers to grow up to the idea of looking and planning ahead, and estimating what additional equipment they are going to need, then we will be able to give them something pretty fair in the way of delivery."

The plant of the Motor Trucks, Ltd., at Brantford, is being cleared out at present to make room for a new line to be undertaken by a number of the same men who were interested in Motor Trucks in the first place. They are placing orders now for considerable equipment for the making of washing machines, etc.

Supplies Keep Up Well

The supply business keeps up well, considering the near approach of Christmas. Dealers had been anticipating a let-up at this season, but it has not occurred. Prices remain the same. From the dealers' point of view, there is a little improvement, if anything, in that there has been no price cutting for some days. The competition on high-speed and carbon cutters had been particularly keen for some time, and there had been a tendency to depart, to some extent, from 10 off the list, which has been the prevailing figure. Several dealers reported to-day that all the selling now on high-speed cutters was being done at 10 off the list, and nothing more.

The Importing of Steel

"Any improvement?' asked CANADIAN MACHINERY of a firm handling steel from U. S. mills.

"Nothing to mention," was the reply, "although there is a very nice tonnage coming through, but it is not over 65 per cent. of what it would be were delivery schedules keeping pace with the business that is coming in.

As noted before in these columns, the premium business is beginning to take root and grow. In fact, it seems that by the time the first robins have arrived in the spring the premium shrub will have grown into a real honest-to-goodness shade tree. It will amount to this: The man or firm in need of quick delivery will have to pay for it, and the man who can book and wait for some months can get his supply at present prices. The Steel Corporation will take on business now at the 2.65 price for plate, but delivery will not be made until third or fourth quarter in 1920. There are other places where delivery will be made more quickly, but the price will hop at once in proportion with the urgency of the sale and the ability to deliver the goods.

Some of the larger mills are booked for a year on bars and shapes, while the capacity is absorbed for six months or so on hoops and plate. Wire mill products are away behind delivery promises, and lapwelded pipe, in some cases, is sold out for full capacity for over a year.

Scrap Market Not Active

Prices the same, business slow, not looking for anything better until after the first of the year. That just about sizes up the scrap market this week. There seems to be a feeling in some quarters that higher prices are due to arrive for several lines before very long. Holders of any quantity of material feel that with the upward tendency of the steel and pig market, they should be caught up in the procesion. Hence they are unwilling to let go at present figures. The scrap market has a very close relation to the price of new metal. In fact, there are times, according to some of the dealers, when they can come within a cent a pound, or even half a cent of new metal, but such cases are unusual.

It looks as though it might be necessary to offer higher figures to bring out some of the material that is being held, as it is quite apparent that those who have it will not sell until such time as they get higher figures.

POINTS IN WEEK'S MARKETING NOTES

No improvement is reported in the steel tonnage coming across the line. At best shipments are not over 65 per cent. normal.

Many steel mills are booked for a year in bars and shapes. Wire products are hard to get through, and lap-welded pipe is sold out for a year in advance.

Scrap metal market is dull, and the opinion grows that prices must move to a higher figure in order to get those holding material to let it go.

Supplies and small tools are doing a brisk business. It is generally conceded that the shading of prices on high speed cutters has been stopped, and a uniform policy of 10 off list seems to be generally recognized.

One order placed by a Canadian firm this week included a machine, shipment of which was not expected until December of 1920.

Canadian dealers who have had occasion to visit the United States markets report that makers of machine tools are booked for months to come.

Several changes in representation in the Toronto field are being announced by the machine tool makers.

Pittsburgh reports do not look for capacity production of steel before March.

Baldwin's Limited, now operating and completing British Forgings plant, announce that they will add open hearths to their equipment.

Automobile business continues to do large buying in the United States, and the bringing out of new lines of medium-priced cars is announced.

Premiums are being paid on plate now. Plate, on account of the large finishing capacity at U. S. mills, was for some time looked upon as the weak point in the market.

MANY BUYERS IN NEW YORK MACHINE TOOL MARKET JUST NOW

Special to CANADIAN MACHINERY.

NEW YORK, Dec. 25, 1919.—Machine-tool business is keeping up at an amazing rate for this season of the year, and indications are that the holiday season will be minus the dulness that usually characterizes it. A significant feature of the buying in this market in the last two months or more, is that the largest manufacturing companies have been the most active buyers, indicating that these leaders of industry have confidence in the future prosperity of the United States, despite the disturbing international situation. While there are some conservative thinkers who believe that industrial expansion is proceeding too rapidly to be healthy, there is a large majority who view 1920 prospects with a great deal of optimism.

During the past week, the principal buyers have been the American Locomotive Co. and the American Car and Foundry Co., while, in a slightly lesser degree, the Mergenthaler Linotype Co., New York, and the Magor Car Corporation, Passaic, N.J., have been active. The American Locomotive Co. is buying for nearly all of its plants, including that at Montreal, while the American Car and Foundry Co. is buying principally for Chicago and Depew, N.Y. The Buffalo Steel Car Co., Buffalo, is in the market for several plate-working machines. Railroad car business shows improvement, even without buying by the roads of this country, foreign orders having come in at such a good rate that the Magor Car Corporation is sold up for more than a year ahead.

The automobile industry continues to command attention in the East as well as in the Detroit district. It is reported that the new Wills-Lee automobile plant at Port Huron, Mich., will be started soon, and work on a subsidiary plant near Sarnia, Ont., has already been begun. It has been disclosed within the past few days, that the Locomobile Co., of Bridgeport, Conn., and the Mercer Automobile Co., Trenton, N.J., have effected what is virtually a merger, and both of these plants are expected to enter the market soon for new equipment. The Locomobile Co. will put a light, medium-priced car on the market, and the Mercer Co. has re-designed its motor.

The Wright Aeronautical Corporation, New Brunswick, N.J., which last week issued an inquiry for about 200 tools, will build a new plant in New Jersey, and will manufacture Hispano-Suiza airplane motors and the Simplex automobile.

Alfred Herbert, Ltd., 54 Dey Street, New York, which now has a branch office in Toronto, has opened in England a second-hand machinery department, and is in the market for good used American tools of standard make, for shipment to England. The scarcity of machine tools in England, due to the strike of molders, is reflected in an improved demand here for tools to be shipped to that country, despite the unfavorable rate of exchange.

Commander Weston, of the British Navy, is in New York, and has issued inquiries for a large list of equipment to be bought for a naval air station in Greece. The Royal Naval Hellenic League of Greece is back of the project.

PLATE IS NOW INCLUDED IN THE PREMIUM LIST AT PITTSBURGH

Special to CANADIAN MACHINERY.

PITTSBURGH, Dec. 25.—The view the average steel producer expresses as to the future of production seems altogether too gloomy. The common talk of the steel producers is of their having small tonnage outputs and of their having constantly to turn away customers because they cannot produce the tonnages the customers desire to place. The last thing any of the producers would even dream of, apparently, is of mills running at capacity, as they always did before the United States entered the war when they had orders enough, and by the way it was not so very often that they did have orders enough. There were spells of the mills being filled up, but frequently they did not last long. For instance, the statement, startling at first glance, is absolutely true that between 1906 and 1916 there was not a solitary calendar year in which during part of the year at least the mills did not run slack for lack of orders. The disinterested observer, in other words the market reporter, confesses to a slight feeling of irritation, not because the mills talk as if operating at capacity were out of the question, but because they seem, if not to enjoy the situation, at least to be contented with it. One would assume that their philosophy is that the less producers can produce the more money they can make. At the same time there is universal complaint and criticism that the average workman is no longer willing to do a full day's work. What is the difference, really, in the mental attitude?

The steel mills and departments that were closed from lack of coal—no large proportion of the total at any time—have made a rapid resumption since the coal strike was ended. The Indianapolis settlement was Wednesday, December 10, and on the following Monday there were many resumptions. There was, moreover, a large number of openings of mills in the Wheeling district, mills that had been closed since the beginning of the iron and steel strike September 22. In this category, for instance, are the two pipe mills in Wheeling, of the Wheeling Steel & Iron Company and the Steel Corporation, also the La Belle and Laughlin tinplate works of the Steel Corporation. The resumptions were not in full, of course, but full operation ought not to be long delayed. By this date all the capacity that was thrown idle by coal shortage is in operation again. The resumption came quickly because many of the mills did not have to wait on freshly mined coal, after the settlement of the labor difficulty, there being large quantities of coal on track held by the railroads under instructions of the Fuel Administration and when it was seen that coal mining at the union mines was to be resumed at once the coal available was released. Much of this coal was at destination, as originally consigned, and merely had to be released. Some estimates are that of all the coal held by the railroads on November 1, consigned to consumers, about one-third remained on December 10, the date of the settlement.

Steel Scarce

The scarcity of steel grows from week to week, despite the fact that production has been increasing since October 1, or since just after the beginning of the strike. This is due, of course, to the exhaustion of stocks, and perhaps it is due in part also to fears of consumers that they will be short of steel in the early months of next year. There are no early deliveries, and practically no first quarter deliveries, except at premiums above the March 21 prices, the prices the Steel Corporation is rigidly adhering to, with a little company on the part of some of the large independents. Sellers at March 21 prices are dealing only with regular customers, not taking any orders from outsiders, and even at that they can only rarely promise any deliveries to begin as early as March.

The scarcest products are special grades of sheets, practically all pickled sheets, hot and cold rolled strips steel, wire nails, various descriptions of special wire including spring wire, and line pipe. There are no descriptions that are really plentiful. The situation as to scarcity is brought out by the fact that even in plates, expected to be a drug on the market on account of the great increase in capacity during the war, premiums are now the rule. A month or six weeks ago plates on attractive orders could be had at 2.50c, Pittsburgh, the March 21 price being 2.65c, but in the past ten days plates in larger than thousand ton lots have sold at 2.75c, and small lots might easily command still more. While very little car buying has been reported, the car shops are buying in a fair way, partly for repair work and partly against export orders for cars. In the circumstances, if plates are scarce no finished steel product can be plentiful.

Steel business in general has tapered off somewhat in the past few days and the usual holiday dullness will doubtless

obtain until the fore part of January. Whether the excited market conditions of the past few weeks will promptly reassert themselves, however, is a question. There are some elements in the general business situation that are not favorable, but seem to have received attention by only a few in the trade. The impression that the market is altogether one-sided and will easily take care of itself, has been, perhaps, too universal.

Pig Iron Advances

If the pig iron advance is over, it has stopped only now, for there have been advances to date. On fair-sized sales for extended delivery Bessemer has brought $36, valley, an advance of $1 over last quotations, while basic similarly has brought $35, valley, an advance of $2 over last quotations. Foundry iron remains at $38, valley, for prompt and first quarter, but there is a new development in that for second quarter alone foundry iron has brought $38, having previously sold, if at all for that delivery alone, at somewhat less. The pig iron advance now averages fully $11 a ton from the beginning of June, this $11 amounting to slightly over 40 per cent. on the basis of f.o.b. furnace prices,,, and slightly under 40 per cent. on the basis of delivered prices.

Coke is still very scarce. By-product coke production began increasing immediately after the coal mining settlement, but is only now at approximately normal. Week before last beehive oven production was subject to restrictions and the Connellsville and Lower Connellsville region produced 27 per cent. less than in the preceding week. Last week the ovens were entirely free of Fuel Administration restriction, but after Monday car supplies were restricted by reason of the heavy movement of coal and there was little if any increase in production. This week there is the holiday, always a restrictive influence, though probably this year not so much on account of the country being dry. The furnaces dependent on Connellsville coke had accumulated some stocks and few furnaces have had to bank, though a number are operating at reduced rates. Inquiry for foundry coke has been limited in the past week, indicating that foundries had accumulated stocks. Government price limits remain on coke, $6 for furnace and $7 for foundry at ovens, in the case of Connellsville.

EXTENSIONS MADE AT ROBB ENGINEERING

The Deputy Minister of the Naval Care of Increasing Business Joint Committee Plan

Considerable extension to premises is being made by the Robb Engineering Works of Amherst, N.S. The company is undertaking the manufacture on a somewhat larger scale, of the Baker-Robb Farm Tractor, which has been tested out thoroughly in the Northwest, and also in the Maritime Provinces, during the past two years. Extensions are also made in the line of water tube boilers. New equipment is being ordered to take care of the increasing business in these lines.

The Robb Co. has also in operation in its plant a joint committee of employees and management, with equal representation. Good results have been obtained in this way. and both sides are well pleased with the way the joint committee is working out.

BELGIUM IN NEED OF LOCOMOTIVES

Orders for Railway Cars May Also be Placed in This Country Soon

London, Eng.—Canada has been negotiating with Belgium for the relief of railway congestion in the latter country by the building of locomotives in Canada for Belgian railways. It is understood a contract will be placed with the Montreal Locomotive Works. So badly does Belgium need the rolling stocks that an order for one hundred locomotives was recently given to Armstrong-Whitworth Company, of Britain. The Canada Car and Foundry Company has also been negotiating for the supply of cars to Belgium, but it is not known whether the overtures have been successful. Canadian business men, who have visited Belgium, complain that Belgian firms will not do business direct with them but only through the medium of agents in London.

U.S. SCRAP METAL

The market is strong, with further advances being made. Scrap is being bought for export. Following are reports from U.S. points:—

NEW YORK.—There have been some heavy sales of heavy melting steel and steel car axles for export. Japan, England and China have been buyers. The scarcity of pig iron has resulted in a good demand for cast scrap for domestic purposes. Cast scrap is now $26 to $27 f.o.b. New York, and $28 to $29 for machinery cast.

PHILADELPHIA. — Heavy melting and turnings have weakened, the latter selling at $18 delivered. Re-rolling rails, forge and bundled sheets, shafting car wheels, and iron and steel axles are stronger.

BOSTON.—Some grades have dropped due to mills shutting down through shortage of coal. Prices of turnings have dropped $1. No. 1 machinery has sold at $36. Heavy cast scrap is $32. Steel armor plate was bid for at $30 per gross ton.

PITTSBURGH.—The demand for steel making scrap is not very heavy, but prices hold firm. Better business is expected at the beginning of the year. Some small lots of heavy melting steel have been bought at $24 to $24.50, but larger tonnages would probably realize $25.

BUFFALO.—There is a heavy demand for heavy melting steel, and $23.50 is easily obtained for this grade. Turnings and borings have also been active. Scrap shipments have been suspended till mills ascertain what their fuel supplies are likely to be.

CLEVELAND.—Shortage of cars and the uncertain fuel situation have made trading quiet, but dealers are not disposed to sell their stocks, except at enhanced prices. Heavy melting has realized $21.25 Cleveland. Steel rails, machine shop turnings, grate bars and stove plate have all advanced.

PIG IRON TRADE

Pig iron has reached the $40 mark in recent trading. The demand is still strong. A large quantity of off iron which appeared was soon absorbed.

Following are reports from various centres:—

PITTSBURGH.—The position of the pig iron market is very strong. Production last month was estimated to be nearly 100,000 tons short of demand. Foundry iron for 1920 first half has sold at $38 valley furnace, 1.75 to 2.25 silicon. Standard Bessemer has advanced $1.00.

BOSTON.—The end of the year has brought a decrease in the demand for pig iron. Demand for 1920 is good. Alabama iron is established at $36 furnace, for New England delivery, while Virginia iron is $38 furnace. Some sales for second half have been made for $40 furnace, for 2.25 to 2.75 silicon Eastern iron.

NEW YORK.—About 25,000 tons of iron which came on the market recently has been absorbed at prices below those for standard iron. There has been little selling of standard iron, makers not wishing to take further orders. $41 furnace for 1.75 to 2.25 silicon has been obtained, and $42 for the next grade.

PHILADELPHIA.—A number of furnaces are booked up for first half, and in some cases for several months after that. Virginia iron is selling at $38 furnace for 1.75 to 2.25 silicon, and $39.25 for 2.25 to 2.75 silicon. Malleable has sold for $38 Eastern Pennsylvania furnace for spot shipment.

BUFFALO.—There is a scarcity of iron for first half, and no first quarter is to be had. There is a strong inquiry for foundry iron, mostly in lots of from 300 to 500 tons.

CINCINNATI.—Demand is strong, but furnaces are not looking for business. They have plenty of business, and $40 for No. 2 second quarter Birmingham is a minimum price.

ST. LOUIS.—There is a strong demand, and there is not much iron available for 1920 delivery. Prices are strong. There have been a few sales for spot shipment, and small foundries are getting short of iron.

SELECTED MARKET QUOTATIONS

Being a record of prices current on raw and finished material entering into the manufacture of mechanical and general engineering products.

PIG IRON

Grey forge, Pittsburgh	$33 00
Lake Superior, charcoal, Chicago	38 40
Standard low phos., Philadelphia	40 00-40 00
Bessemer, Pittsburgh	35 00
Basic, Valley furnace	30 00

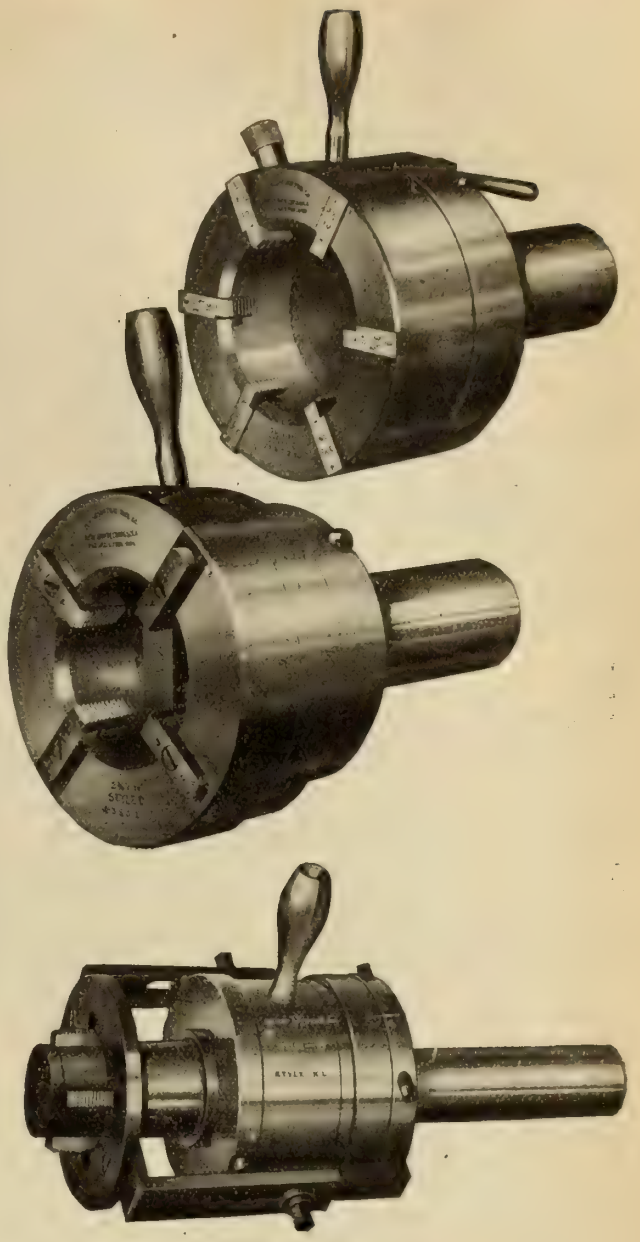
A GOOD BOON

"Geometric Tools are a good boon in our business. Always reliable and sure of turning out a class job; in fact, I don't know how we could secure a decent output without them."

This is what the Works Inspector of a London (England) shop says. He adds that they are making screw and small parts for air craft, and have quite a lot of Geometric Dies in constant use.



Because of the fact that Geometric threading tools are "a good boon" in the thread cutting business, the majority of screw machines and turret lathes are equipped with Geometrics.

The Week's Events in Montreal Industry

Geo. Bernard, formerly sales manager of the A. Bernard Industrial Company, of Fortierville, Que., has been elected a director of the company and promoted to the position of general manager, retaining charge of the sales department. M. A. Bernard, formerly general manager, has been elected president.

Continuing to recognize the undersupply of bituminous coal for the full operation of nominal railroad service, officials of the Canadian roads have stated that with few exceptions the curtailment of trains and other activities, requiring coal a fuel, will be effective for some time yet. The duration of this period will depend on the severity of the winter and the time required to return the coal supply to normal.

The Engineering Institute of Canada has made full arrangements for a Dominion-wide convention to be held in the city of Montreal on January 27-29. During the meeting several important papers will be read and discussed; a number of federal and provincial officials will likewise be present, some of whom will give addresses on the activities, past, present and future, of their respective departments, principally in relation to engineering work. The convention will be held in either the Ritz Carlton or the Windsor Hotels.

With the sailing of the Canadian Government steamer "Canadian Planter," from the Canadian Vickers yard on December 12, the commercial closing of the Port of Montreal became effective. The official termination of harbor operations, as far as ocean activities are concerned, took place a few day earlier when the Elder-Dempster freighter "Bassa" sailed for South Africa. This vessel had to undergo light repairs after being stuck on the mud bank for over a week, during which period she had to be lightened of a large portion of her cargo.

For several months past the city of Montreal has been experimenting with the use of fuel oil at the Low-Level Pumping Station. Three boilers have been equipped with oil-burning apparatus, but it has been found necessary to revert back to coal firing on two of these, the other remaining as an oil unit, while further tests are being made. So far, the oil method has not proved successful, and the city has assured itself of constant water service by laying in a full supply of coal for winter requirements. A year's supply for this station is in the neighborhood of 56,000 tons.

At a recent meeting of the Montreal Chambre of Commerce, Lieut.-Col. Hercule Barre, newly-appointed Canadian Commissioner to Paris, emphasized the importance of Canada's commercial representation in many parts of the world, portending a new era of development and prosperity for Canadian trade. He remarked on the lack of definite information that the Department of Commerce at Ottawa had in respect to Quebec industries and commercial activities, adding that he did not blame the Government so much as the business men of the province in not giving to the department the necessary information.

Recognizing that direct steamship connections between Canada and the British West Indies is one of the chief necessities for the development of export trade, the Montreal Board of Trade, at a recent meeting, unanimously decided to consider the question of confederation of the islands with the Dominion. While expressing satisfaction with the great improvement made in steamship service by the vessels of the National Marine Service, the members felt that even the present efficient service is entirely inadequate to the existing and early future requirements, both as to freight and passenger traffic. A committee of prominent Montreal business men are leaving on a business trip to the West Indies, and they have been authorized to take up the question of closer political relations with the Chamber of Commerce in the islands.

A tribute of the Canadian Marine Department, and to the Montreal Harbor Commissioners in particular, was recently given by Capt. Griffiths, of the C.P.O.S. liner "Scandinavian," when that vessel docked on her last inward voyage of the season. "I have been on this route for the past twenty-two years," he said, "and the thing that struck me most as we came up the gulf and the river was the difference between present conditions and those prevailing when I started on the service. Then it was impossible to come up the river at night at all, and the Port of Montreal was a very medieval concern. On our present trip we were able to proceed at full speed from the entrance to the Gulf, day and night, until we slowed down to swing into the berth, everything along the way being lighted up, so that we had not the slightest difficulty, not only for the light in the channel but the sighting lights on the shore, and when we got into port the arrangements were as perfect as any commanding officer could desire. Whoever may be responsible for it, the Port of Montreal to-day is about as fine a port and harbor as exists in the world, and its accommodation for vessels coming in are wonderfully good."

The increasing trade that is constantly developing between Canada and overseas' countries has resulted in the Government taking greater interest in th facilities of the ocean terminals that will be called upon to take care of this expanding traffic. There is every possibility that the port of St. John, N.B., will be slated for extensive improvements and additions in the very near future as Government representatives recognize the importance of this nerve centre of the inter-Continental trade system. Speaking on this subject recently, A. P. Barnhill, K.C., one of the directors of the C.N.R., said: "The important matter now for the city of St. John is not so much the railroad service as terminal facilities for ocean business. The railroad service is here but we still lack facilities for increasing ocean business that will soon come here. In answer to my representations that St. John is entitled to consideration in the allotment of steamers equal to that given to any other port, the fear has been expressed that there will be congestion at this port. That is, the facilities are not adequate for the steamships which are scheduled to arrive here. It is apparent that these facilities must be greatly increased at once to take care of the business of the immediate future."

The revival of the project to deepen the St. Lawrence for the passage of ocean vessels is again to the fore, and the possibility has created considerable adverse feeling among New York and American shipping men. The statement of J. S. Duthrie, of the MacDonald Lumber Company, who has been a consistent supporter of the St. Lawrence Canal scheme, emphasizes the advantages of such an undertaking, and says in part: "Ocean vessels will be unloading in the ports even of Lake Superior within ten years. The only thing that will delay it is the fact that the Government has taken over the G.T.R. and tied up the finances of the country for the time being, but that will soon be past. The people of New York see the real facts of the case." S. A. Thompson, the secretary of the Convention of National Rivers and Harbors Congress, expresses the mind of the Eastern section of the States in the following remarks: "Like all the rest of us, the people of New York and the Eastern States want all the business they can get, and because they think, with good reason, that a thirty-foot channel down the St. Lawrence could not only benefit Montreal, but take a great amount of business away from New York, they are violently opposed to the United States Government taking any part in the project."

Voting on By-Law.—Goderich votes on Jan. 5 in regard to granting concessions to the Dominion Road Machinery Co. Exemption from all but school taxes is being asked.

ADMIRALTY DECIDES TO OPEN UP FOR BUSINESS WITH THE FIRMS HERE

"Canadian Export Pioneer":—In reply to "The Pioneer's" enquiry regarding the admission of Canadian competition for Government store contracts, which was the subject of correspondence with various Departments, published in our October issue, we have received the following communication from the Admiralty:

"Sir,—In reply to your letter of the 10th inst., addressed to the Secretary of the Admiralty, on the subject of the eligibility of Canadian firms to contract for the supply of stores required by the Naval Service, you are informed that it is the policy of the Admiralty to place as large a proportion of orders as possible for supplies obtained from abroad with the Colonies.

"During the war the resources of the Dominion were utilized to a great extent in the work of shipbuilding and the provision of munitions of war, and amongst the many commodities drawn from that source may be mentioned the following:

Timber, salmon, cheese, jam, carbide, crude asbestos, aluminium powder, ferro-silicon, underclothing and hosiery.

"It will be realized that the placing of orders in the Dominion involves the following considerations:

(a) Longer time for delivery.

(b) Increased price owing to cost of freight.

(c) Difficulties connected with the inspection of goods, and correspondence and conveyance necessitated by rejections in this country.

"In regard to the latter consideration it would, of course, be of great assistance if the Canadian suppliers had agents in this country, and this is usually required.

"With reference to the last paragraph of your letter, it would be inconvenient at the present time to prepare a detailed list, but the enclosed copy of a pamphlet drawn up prior to the war may be of interest, and furnish you with some idea of the variety of supplies required for the Naval Service.—I am, etc.,

(Signed) "C. A. OLIVER,
"For Director of Contracts.

"Admiralty, London, S.W., October 24."

Hints to Applicants

Very careful enquiry is made by the Admiralty as to the position, capability, and responsibility of manufacturers unknown to the Department before an order is entrusted to them, and the punctual and efficient performance of a first contract by a firm is an essential condition of their receiving further orders. Applications from firms seeking admission to the Admiralty's list of tenderers are dealt with solely on the merits of each case. Such applications should be addressed to the Director of Navy Contracts, Admiralty, London, S.W., and should state the class of work for which it is desired to tender; particulars should at the same time be furnished of the situation and capacity of applicants' works, and references should be given to a bank, and to firms who can testify to the quality of the firms' manufactures and to their capability for undertaking contracts.

Before a firm is admitted to the list an undertaking is required that "Fair Wages" conditions, as provided in Resolutions of the House of Commons, will be duly observed in the execution of any orders entrusted to them.

"Bring me two fried eggs, some ham, coffee and rolls," said a man to the dining car waiter.

His companion said: "Bring me the same—wait a moment—just eliminate the eggs."

In a moment the waiter returned and confidentially remarked: "We had a bad accident jest afo' we left de depot, boss, an' de 'liminator done got busted off, right at de handle. Will you take yo 'eggs fried same as dis hyar gemman?"

TRADE GOSSIP

Restrictions Removed.—The local restrictions on soft coal have now been removed. As soon as Mr. Harrington, the Ontario Fuel Commissioner, was notified of the removal of the embargo by the United States authorities, he made the announcement rescinding the order issued by him during the strike.

The Department of the Naval Service will receive tenders up till January 2 for the construction of three first-class single screw tugs. The approximate dimensions are: Length b.p., 75 feet; breadth, moulded, 17 feet 6 ins.; depth, moulded, 9 feet; to be delivered at Stanley or Kingsville, Ont. Full specifications and particulars can be obtained from the Department, Ottawa.

Anxious to Get Back.—There are a large number of aliens arriving in Montreal from the West daily. They are coming in anticipation of the declaration of peace, which will enable them to get back to their homes in Europe. The Registrar of Aliens is receiving as many as 500 reports daily. They will very likely have to remain in Montreal all the winter, owing to lack of transportation facilities.

First Tin Ingots.—The first tin ingots from the electrical smelter of Brantford were on exhibition in the city, the first actual results of the enterprise which promises to develop into a very big concern in that city. The ingots from the ore, the latter brought all the way from Bolivia, were 97.7 per cent. pure tin, and there is every reason to believe that the operations will prove successful on a large scale. The furnaces installed have a capacity of two and a half tons per day, which will take some little time to reach when production has been developed in the way planned.

Molybdenite in Ontario.—There are several mines operating in Ontario recovering molybdenite ore. The International Molybdenum Company operated the Moran mine in Brougham Township, and also operate a concentrator at Renfrew and a smelter at Orillia. The Renfrew Molybdenum Mines have a property at Renfrew, which produced about 60,000 lbs. for the year. The Wilberforce Molybdenite Company, Ltd., has a property in the township of Cardiff. The Steel Alloys Company have a mine at Brougham. The Molybdenum Products Company, Ltd., has a mine at Monmouth, Haliburton County. W. E. Joiner & Co. have a mine near Wilberforce, in the township of Cardiff, and another about 15 miles south-east of Wilberforce.

PERSONAL

Hugh A. Chisholm has been appointed Canadian Trade Commissioner to Cuba, and his address will be 501 and 502 Antigua, Casa de Corres, Tenient Rey 11, Havana, Cuba. He is at present

calling on the Canadian trade, finding out makers or dealers who may be interested in making a Cuban trade connection.

MARINE

Victoria.—Premier Oliver of British Columbia, after hearing the representations of a delegation of returned men, wired to Hon. Dr. S. F. Tolmie, Federal Minister of Agriculture, urging that the Government place orders for wooden ships in B. C. and proceed with other public works.

Cobourg. — One of the coal ferries plying between Cobourg and Charlotte was damaged at the latter port, and was unable to make the trip across. Mr. Harrington, Provincial Fuel Commissioner, said that arrangements would have to be made to ship the coal to Toronto by way of Black Rock.

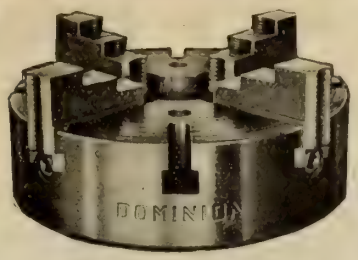
Goderich. — The steamers Martian, Midland King, Osler, and Hagarty, have been diverted to Goderich to unload and lay up for the winter. All other Georgian Bay and Lake Erie ports are frozen up. A good many boats have already arrived and discharged their grain cargoes at Goderich, and moored for the winter, so there will be plenty of room for the late arrivals.

Port Arthur.—The steamer Glenlyon of the Great Lakes Transportation Company arrived at Port Arthur later in the season than any steamer has ever arrived from the East. She was five days making the trip from the Soo, keeping the north shore close aboard and being in touch with Port Arthur by wireless during the whole run. The temperature varied from zero to 35 below, the result being the deck cargo is frozen solid and will have to be dug out.

Quebec.—A seizure has been filed on the Canadian Government steamer Canadian Trapper by the Tidewaters Shipbuilding Company of Three Rivers. The respondent in the case is the Davie Shipbuilding Company of Quebec, who have not yet delivered the vessel to her owners. The action arises out of a claim for $180,000 for machinery and other work performed by the Tidewater Company.

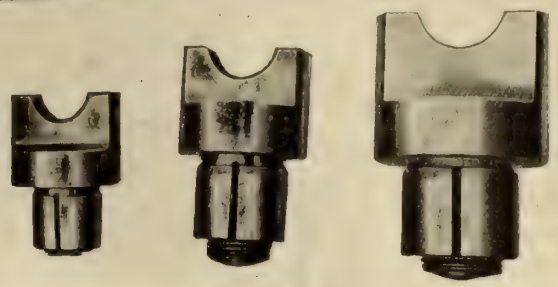
Cheboygan, Mich.—The fishing tug Rideout was sunk through the ice cutting through her planking. and her cargo is a complete loss. The dummy light at the entrance to the river is now out of operation, and the keeper, Charles Luoisignan, who has been marooned. has come ashore. Martin's Reef lightship came in for coal, and afterwards left for Spectacle Reef and Poe Reef to bring the crews and lightships ashore.

Toronto.—The Harbor Commissioners have approved the expenditure of $4,000,000 on the harbor wall of Toronto. The bonds have been guaranteed by the city. Improvements for next year include an amusement centre between Sunnyside and the Humber, the commencement of the sea wall east of



DOMINION CHUCKS

STEEL OR CAST-IRON BODY
BUILT FOR HEAVY DUTY



Thrust Blocks are made of high-grade steel, case hardened

THE THRUST BLOCKS are held in place by a tapered headless screw, which expands the stem and firmly holds it in place. Thrust block screws are made of mild steel, tapered and case hardened.

The chuck screws are made of a durable quality of high grade steel heat treated after machining; are large in diameter and reversible, both ends being broached to take the chuck wrench. These chucks were developed by us to meet a need for accuracy and extreme heavy work. They have stood the test by delivering the most dependable service.

TENDERS

The deputy minister of the Naval Service, Ottawa, is receiving tenders up to January 2, 1920, for the construction of three first-class single screw tugs of approximately the following leading dimensions, namely: Length between perpendiculars, 75 ft. 0 in.; breadth moulded, 17 ft. 6 in.; depth moulded, 9 ft. 0 in.; to be delivered at Port Stanley or Kingsville, Ont.

BOOK REVIEW

Machine Tool Operation, Part I, the Lathe, Bench Work and Work at the Forge. By Henry D. Burghardt. The McGraw-Hill Book Company, New York, Price $2.00.

The purpose of this text is to assist those who desire to get a knowledge of the principles and elementary operations of machine shop work. It is in no sense a treatise, nor is it a production manual. It is primarily designed to be used in connection with class talks or demonstrations in the school shop, although it may be used to supplement the information which a boy in a commercial shop may acquire by observation, practice, or other means. The author's aim, as stated in his preface, has been to adopt this text for use in vocational, industrial, technical and trade schools and in apprenticeship courses where training in shop practice is given.

Contents: The machinist's trade; lathe construction and manipulation; cutting tools and cutting speeds; the scale, caliper, snap gauge and micrometer; centering; facing; turning in a lathe; chucking work; tapers and angles; threads and thread cutting; face plate work; hammers, screwdrivers, wrenches, hacksaws; laying-out; chipping; filing; scraping; work at the forge.

THE BARK TEST

Two sailors at a dog show were gazing at a valuable Skye terrior, which had so much hair that it looked more like a woollen mat than a dog.

"Which end is 'is 'ead, Tom?" asked one.

"Blowed if I know," was the reply, "but 'ere, I'll stick a pin in him, and you look which end barks!"—Blighty (London).

Voting in Dunnville.—On January 5 the people of Dunnville vote on the question of granting a fixed assessment of $10,000 for ten years to the Canadian Engines, Ltd. The company agrees to pay out $40,000 annually in wages.

Forgings

The sale by the Dominion Forge & Stamping Company, Limited, of their Stamping Plants, means that the energies of the Company will be concentrated on their forging business.

Extensions to this plant are now being made which will greatly increase its capacity; and the plant will continue to be one of the largest and best equipped drop forge plants anywhere.

Quotations are made to customers' specifications and your enquiries are solicited.

A Little Act of Courtesy That is Good Business

BY simply mentioning CANADIAN MACHINERY when writing to our advertisers you will be doing something which will prove of three-fold benefit.

First—It will benefit you because it enables the advertiser to immediately associate your enquiry with the product advertised, resulting frequently in quicker service.

Second—It will benefit the advertiser because it enables him to identify and classify enquiries and to give credit where credit is due.

Third—It will benefit **your** paper because in the records of the advertiser it will receive the credit for your enquiry, instead, perhaps, of some less deserving medium.

We are always grateful for favors of this kind. It costs the reader nothing, and yet as we said before, it is of three-fold benefit.

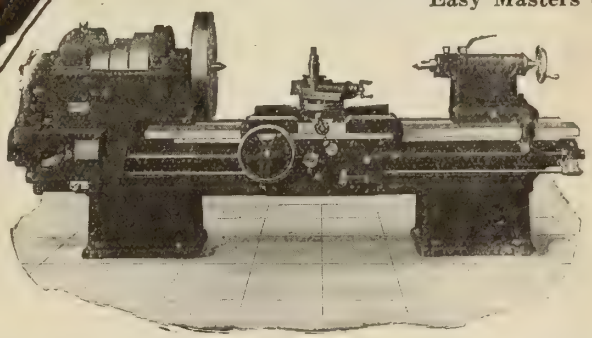
If interested tear out this page and place with letters to be answered.

SIDNEY

Heavy Duty Lathes

The 25-inch Heavy Duty Quick Change Sidney shown below is the last word in lathe construction. Every possible improvement will be found in this late model. Bed lengths available are 10, 12, 14, 16, 18 and 20 feet. Also built with a 27-inch swing.

Easy Masters of Big Jobs



Regardless of the severity of work, dependence put on Sidney Lathes has never been misplaced. The Sidney line has made good—with a vengeance. New Bulletin just issued on 25-inch machine. Write to-day!

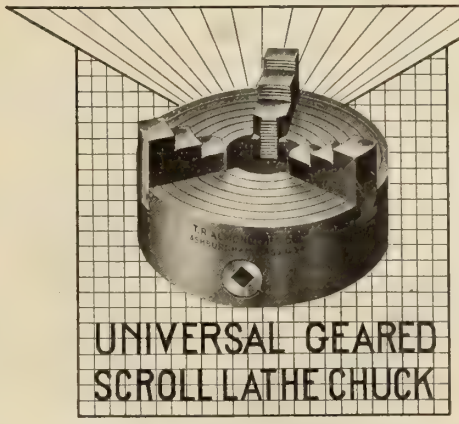
FOR SERVICE

ALMOND



The body is a one-piece casting which eliminates parts and chattering when under heavy cutting pressure. The jaws are made of special alloy steel and hardened through making them stronger than the usual case hardened jaws. Two styles jaws—No. 1 Common Jaws, No. 2 Reverse Jaws.

OTHER ALMOND PRODUCTS

Drill Chucks, Right Angle Transmission Micrometer Calipers, Flexible Steel Tubing.

T. R. ALMOND Mfg., Co.
Ashburnam, Mass.

H & G

Die Head Cuts
Perfect Threads

The H. & G. Die Head illustrated is only 3⅝" outside diameter, yet it will cut from the smallest up to 1" standard thread and up to 1⅛" fine threads. For absolute proof of its ability to stand up and give good results, see the perfect threads it cuts on nickel steel. You can see these many places, but in almost any automobile or areoplane plant for certainty.

Made in 9/16", 1", 1½" and 2" sizes.

No stronger, more durable, more accurate Die Head was ever made.

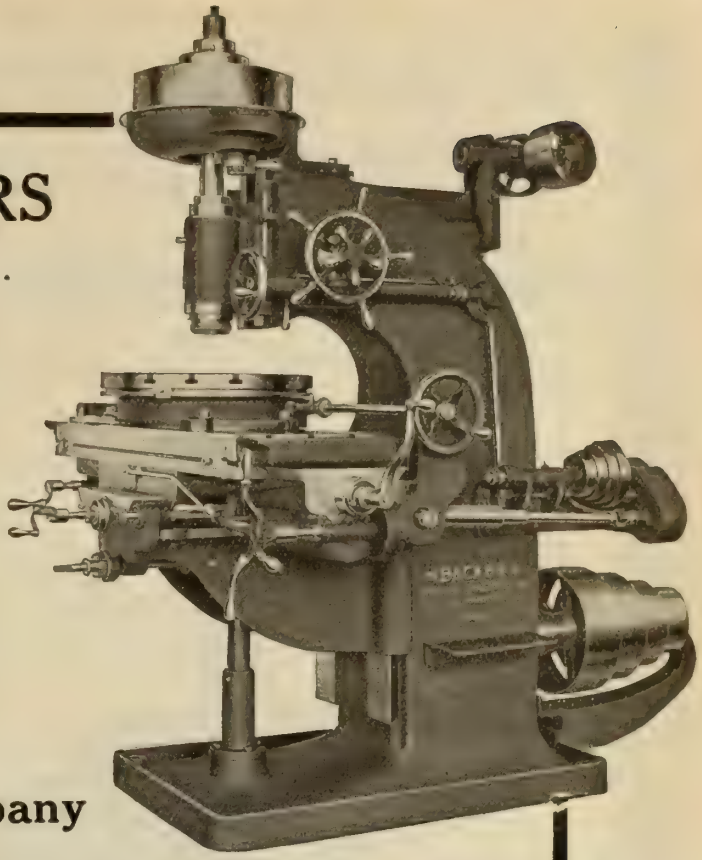
If interested tear out this page and place with letters to be answered.

BECKER BELT-DRIVEN MILLERS



for

GREATER PRODUCTION because they work continuously—every hour of operation is a production hour—

ECONOMY OF OPERATION because they are power savers; the internal belt drive forms an elastic drive to the spindle that prolongs the life of the cutter by eliminating chatter and vibration.

ACCURACY because the machines have exceptionally fine feeds and are equipped with micrometer dials and stop gauges. The Patent Becker Gibbing keeps the work permanently aligned with the spindle.

Becker Milling Machine Company
HYDE PARK, BOSTON, MASS.

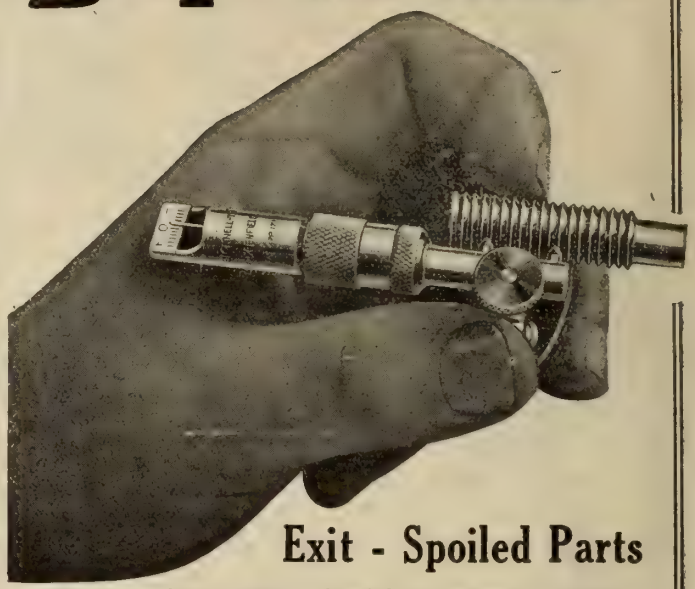
B-T THREAD LEAD INDICATOR



Exit - Spoiled Parts

Did you ever have to scrap a threaded part because of incorrect measurement in lead? Were you ever forced, during a rush job, to thread a part over again, because it didn't fit as it should?

B-T THREAD INDICATORS

enable you to get the right thread lead instantly and maintain a constant check upon it. They will detect errors of one thousandth of an inch—can be used for testing odd and even pitches, as well as internal and external threads. **Send for our Booklet.**

"HISCO" Moulded Gears

WHY pay for expensive patterns when you install new machinery that necessitates special gears? "HISCO" machine-moulded gears, while requiring no pattern, insure accuracy, dependability, quality, and the price is minus the cost of patterns—which in these days of high prices of lumber and labor is something to be considered.

THE "HISCO" plant is equipped to produce machine-moulded gears up to 18 feet in diameter without patterns—and remember, very often the pattern costs more than the gears. *Write for our Estimates.*

HULL IRON & STEEL FOUNDRIES, LIMITED
HULL - - CANADA

Announcing—

WILLIAMS' "Vulcan" Forged-Cutter Tool Holders give unequalled service to those who prefer the solid, forged-type of cutting tool. Each Holder, by the mere insertion of small High Speed Forged-Cutters is adapted to the heaviest service on Lathe, Planer, etc.

The economy and convenience of this line, when installed as standard shop equipment, is at once apparent, as all blacksmith work, to say nothing of the very considerable investment necessitated by heavy, solid forged-tools of costly High Speed Steel, is eliminated.

Absolutely simple in construction, yet possessing all the advantages of the solid tool without its expense.

Cutters, drop-forged from the finest grade of High Speed Steel, in stock in a great variety of sizes and types, finished and hardened ready for use. Ask for descriptive booklet.

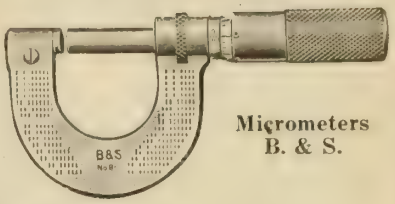
Best Wishes for the Coming Year to all Our Friends

Machine Shop, Foundry and Construction Supplies



Micrometers B. & S.

"Vulcan" Pipe Vises and Pipe Wrenches

In addition to the tools shown, our line includes Set Screws, Cap Screws, Machine Screws, High Speed and Carbon Drills, Files (extra large stock) and a complete line of machinists' tools (Starrett, Brown & Sharpe, etc.)

We also carry a heavy stock of **Bar Iron, Sheet Iron (black and galvanized), Machine Steel, Cast Steel, High Speed Steel, Cold Rolled Steel, etc.**

Pleased to quote prices and time of delivery.

Torches

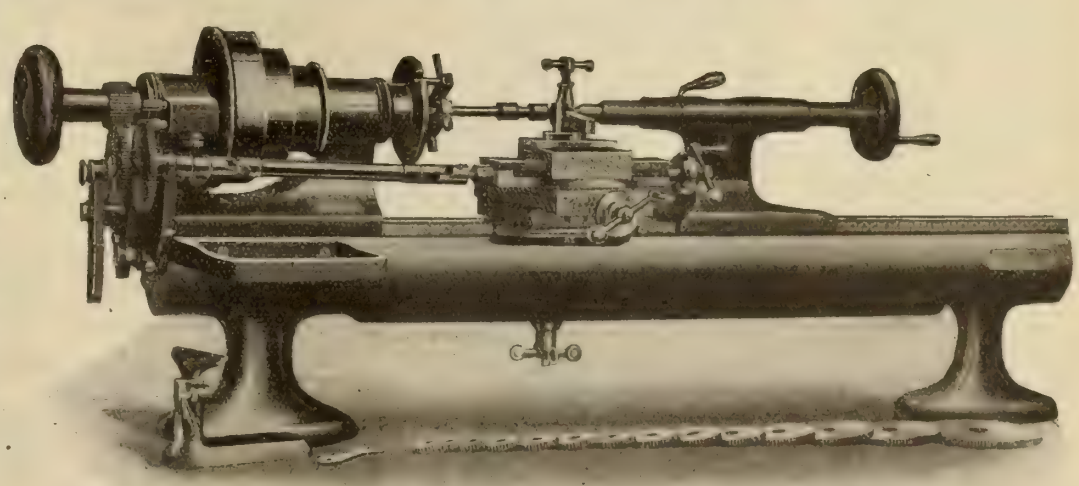
RICE LEWIS & SON, Limited

ESTABLISHED 1847

19 Victoria Street, TORONTO, ONT.

CATARACT BENCH LATHES AND ATTACHMENTS

Cataract Bench Lathes are finely constructed precision tools, with responsive controls, simple adjustments and numerous convenient attachments adapting them to a wide variety of work. **Study this illustration.** Note the base, the circular bed, the sliding tool post, massive head stock (indicating strength), range of gears, special tailstock, arrangement of gears.



Hardinge Bros., 1770 Bertau Avenue, Chicago, Ill.

ALFRED HERBERT CO., Limited, Coventry, England, are our representatives for United Kingdom, France, Belgium, Russia, Japan, Manchuria, Korea, Formosa, China, Italy.

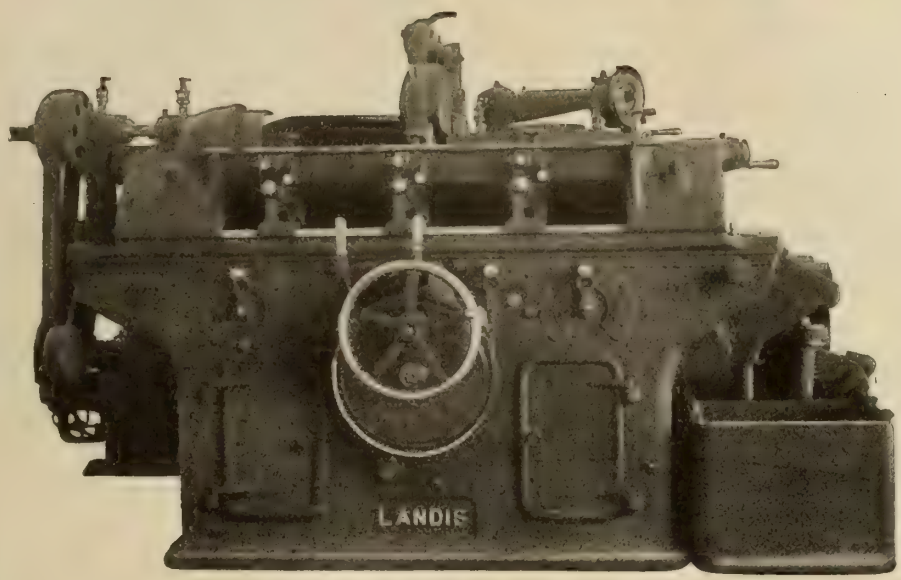
LANDIS

Accuracy--- A LANDIS Attribute



No matter how excessive the tool-load may be, there can be no variation of the degree of accuracy because the work is held stationary —and "the wheel travels."

In addition the Landis is compactly and rigidly built to avoid any chatter.

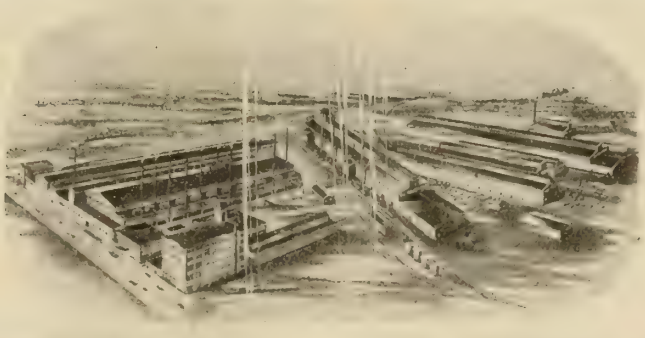
A study of the machine will convince you of its many advantages and its fool-proofness. The built - in, labor-saving features insure big production.

Let us send you our catalog.

LANDIS TOOL CO., Waynesboro, Penn.

50 Church Street, New York City

A Plant Equipped in Every Detail to Suit Your Every Need



STEEL PRODUCTS

Open Hearth, Basic and Acid, Electric and Alloy Steels.

CASTINGS

For Ships, Railways, Rolling Mills, Gears, Machinery and Ingots to 35 tons.

RAILWAY SPECIALTIES

Penn Couplers, Bolsters, Truck Side Frames, Draft Gears.

FORGINGS AND BILLETS

Heavy Ship Forgings, Locomotive and Car Axles, Miscellaneous Forgings.

PLATES

Plates and Heavy Sheets to 30 inches wide, Soft and High Carbon, Automobile Plates and Sheets.

AGRICULTURAL STEEL

Soft Centre and Solid Plow Steel, Harrow Discs, Shovel Steel, Cultivator Blades.

DOMINION FOUNDRIES AND STEEL, LIMITED

HAMILTON, CANADA

Use Common Sense

Real Hack Saw Economy requires the use of common sense in the regulation of weight on the saw.

Every machinist knows, when he is using a hand hack saw, that as the blade becomes worn, more pressure must be put upon it if the cutting speed is to be maintained, but he's very apt to overlook that point in using power machines.

As the saw is used the teeth become worn, and what we call the "contact" area, the area of the blade that actually rests on the work, becomes greater. That means friction and a necessity for more pressure to make the blunted teeth cut into the work. On a heavy saw 64 pounds pressure is generally about the right figure to start with, but to keep the saw cutting as fast, after it has made twenty odd cuts as it did at first, more pressure-weight is needed.

The Starrett Hack Saw Chart "3" helps every user of Hack Saws to do more work at a lower cost. Copy sent you free upon request. Write for Catalog No. 21 "3"

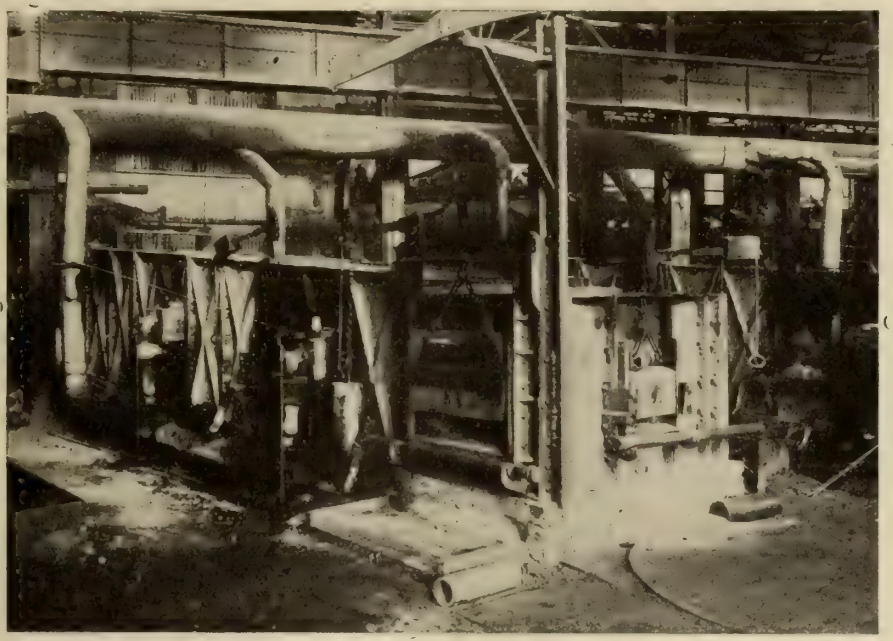
Another MECOL Furnace

demonstrated its superior features point by point to a group of men whose years of experience in the heat-treatment of metals made them appreciative judges.



We refer to the "Mecol" Furnace shown in this illustration, installed at the Pointe St. Charles Works of the Canadian Steel Foundries, Limited.

Our intimate knowledge of heat-treating methods, and our long experience in the building of efficient furnaces fit us to give helpful advice—and that we will do promptly if you

Mill Fire Hose

The masterly qualities of Dunlop Mill Fire Hose—the undeniable superiority under every test—are what secured for the Dunlop line the approval of the Underwriters' Laboratories, Inc., Chicago. The approval takes the form of authorizing Dunlop to use the Underwriters' label; or, in other words, their O.K. mark on every 50 foot length of *"Dunlop Underwriters' Mill Fire Hose" (Cotton Rubber-Lined).*

Underwriters do not have a habit of putting their approval on secondary products. They have a passion for going straight to the brand which has leadership written all over it. You can figure out for yourself the merit Dunlop Hose must have to be so highly regarded by the Chicago underwriters.

Two master brands of Municipal Fire Hose are *"DUNLOP" Double Jacket* and *"IMPERIAL" Solid Woven Jacket.*

Dunlop Underwriters' Mill Fire Hose and Dunlop Fire Extinguishers make an ideal fire fighting combination.

Catalogues supplied on request.

Also Makers of:
High-grade Tires, General Hose, Belting, Packing, Valves, Diaphragms, and General Rubber Specialties.

Service

When you purchase a Garvin machine tool you provide yourself with a means of production in which you can place absolute confidence. It will serve you well and faithfully, with a minimum amount of attention and upkeep.

Garvin machine designs are fundamentally correct — proven so by the fully satisfactory service rendered in plants the country over — workmanship is precise and checked to an exacting standard. Operating economy is second to none. *You can safely trust your product's reputation for accurate machining to Garvin machine tools.*

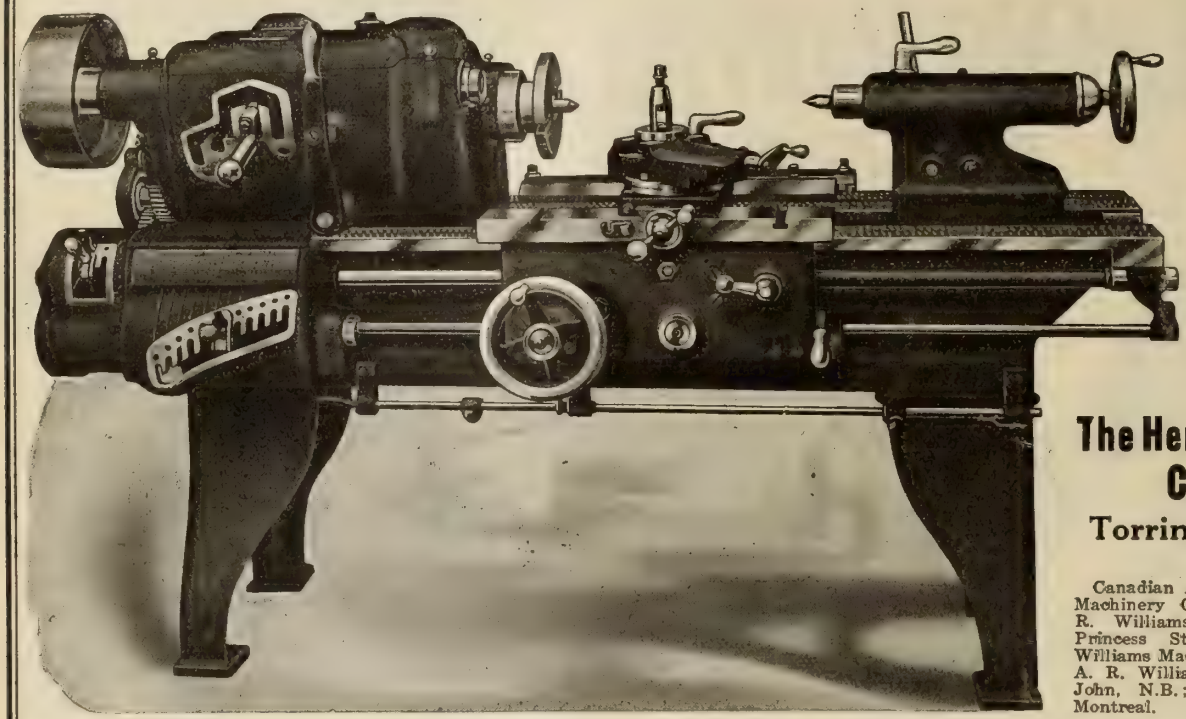
HENDEY 18-inch GEARED HEAD LATHE

8 mechanical changes of speed for spindle with driving shaft running at constant speed, 4 direct and 4 through back gears



36 DIFFERENT THREADS AND FEEDS are had through Mounted Change Gearing, each change being quickly made through controlling handles in Gear Boxes.

BEFORE PURCHASING A NEW LATHE INVESTIGATE THE HENDEY SERVICE.

WE'LL HELP YOU BY FURNISHING LIST OF USERS.

Write for descriptive circular.
